What is Amazon CloudWatch?

Amazon CloudWatch monitors your Amazon Web Services (AWS) resources and the applications you run on AWS in real time. You can use CloudWatch to collect and track metrics, which are variables you can measure for your resources and applications. CloudWatch alarms send notifications or automatically make changes to the resources you are monitoring based on rules that you define. For example, you can monitor the CPU usage and disk reads and writes of your Amazon EC2 instances and then use this data to determine whether you should launch additional instances to handle increased load. You can also use this data to stop under-used instances to save money. In addition to monitoring the built-in metrics that come with AWS, you can monitor your own custom metrics. With CloudWatch, you gain system-wide visibility into resource utilization, application performance, and operational health.

Accessing CloudWatch

You can access CloudWatch using any of the following methods:

- **Amazon CloudWatch console** — <https://console.aws.amazon.com/cloudwatch/>
- **AWS CLI** — For more information, see [Getting Set Up with the AWS Command Line Interface](#) in the *AWS Command Line Interface User Guide*.
- **CloudWatch API** — For more information, see the [Amazon CloudWatch API Reference](#).
- **AWS SDKs** — For more information, see [Tools for Amazon Web Services](#).

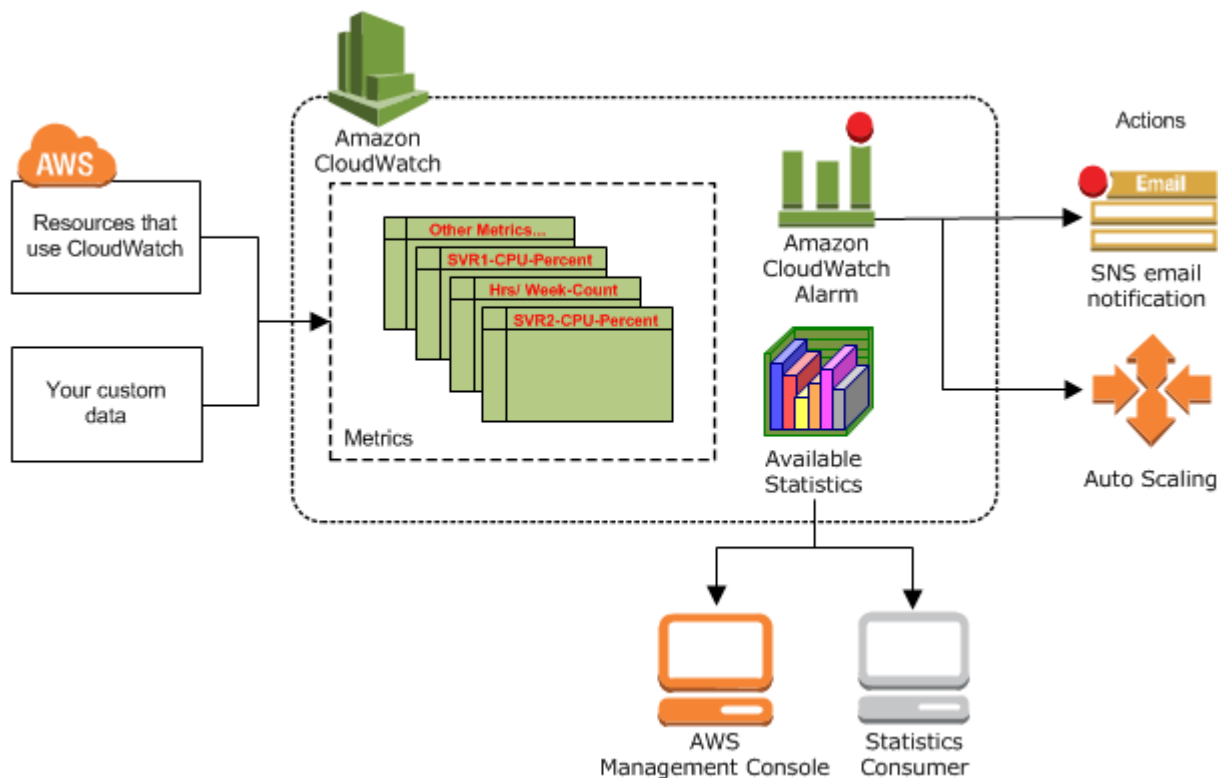

Related AWS Services

The following services are used along with Amazon CloudWatch:

- **Amazon Simple Notification Service (Amazon SNS)** coordinates and manages the delivery or sending of messages to subscribing endpoints or clients. You use Amazon SNS with CloudWatch to send messages when an alarm threshold has been reached. For more information, see [Set Up Amazon SNS Notifications](#) (p. 271).
- **Amazon EC2 Auto Scaling** enables you to automatically launch or terminate Amazon EC2 instances based on user-defined policies, health status checks, and schedules. You can use a CloudWatch alarm with Auto Scaling to scale your EC2 instances based on demand. For more information, see [Dynamic Scaling](#) in the *Amazon EC2 Auto Scaling User Guide*.
- **AWS CloudTrail** enables you to monitor the calls made to the Amazon CloudWatch API for your account, including calls made by the AWS Management Console, AWS CLI, and other services. When CloudTrail logging is turned on, CloudWatch writes log files to the Amazon S3 bucket that you specified when you configured CloudTrail. For more information, see [Logging Amazon CloudWatch API Calls in AWS CloudTrail](#) (p. 309).
- **AWS Identity and Access Management (IAM)** is a web service that helps you securely control access to AWS resources for your users. Use IAM to control who can use your AWS resources (authentication) and what resources they can use in which ways (authorization). For more information, see [Authentication and Access Control for Amazon CloudWatch](#) (p. 288).

How Amazon CloudWatch Works

Amazon CloudWatch is basically a metrics repository. An AWS service—such as Amazon EC2—puts metrics into the repository, and you retrieve statistics based on those metrics. If you put your own custom metrics into the repository, you can retrieve statistics on these metrics as well.

You can use metrics to calculate statistics and then present the data graphically in the CloudWatch console. For more information about the other AWS resources that generate and send metrics to CloudWatch, see [Amazon CloudWatch Metrics and Dimensions Reference \(p. 97\)](#).

You can configure alarm actions to stop, start, or terminate an Amazon EC2 instance when certain criteria are met. In addition, you can create alarms that initiate Amazon EC2 Auto Scaling and Amazon Simple Notification Service (Amazon SNS) actions on your behalf. For more information about creating CloudWatch alarms, see [Alarms \(p. 7\)](#).

AWS Cloud computing resources are housed in highly available data center facilities. To provide additional scalability and reliability, each data center facility is located in a specific geographical area, known as a *region*. Each region is designed to be completely isolated from the other regions, to achieve the greatest possible failure isolation and stability. Amazon CloudWatch does not aggregate data across regions. Therefore, metrics are completely separate between regions. For more information, see [Regions and Endpoints](#) in the *Amazon Web Services General Reference*.

Amazon CloudWatch Concepts

The following terminology and concepts are central to your understanding and use of Amazon CloudWatch:

- [Namespaces \(p. 3\)](#)
- [Metrics \(p. 3\)](#)
- [Dimensions \(p. 4\)](#)
- [Statistics \(p. 5\)](#)
- [Percentiles \(p. 7\)](#)

- [Alarms \(p. 7\)](#)

Namespaces

A *namespace* is a container for CloudWatch metrics. Metrics in different namespaces are isolated from each other, so that metrics from different applications are not mistakenly aggregated into the same statistics.

There is no default namespace. You must specify a namespace for each data point you publish to CloudWatch. You can specify a namespace name when you create a metric. These names must contain valid XML characters, and be fewer than 256 characters in length. Possible characters are: alphanumeric characters (0-9A-Za-z), period (.), hyphen (-), underscore (_), forward slash (/), hash (#), and colon (:).

The AWS namespaces use the following naming convention: AWS/*service*. For example, Amazon EC2 uses the AWS/EC2 namespace. For the list of AWS namespaces, see [AWS Namespaces \(p. 98\)](#).

Metrics

Metrics are the fundamental concept in CloudWatch. A metric represents a time-ordered set of data points that are published to CloudWatch. Think of a metric as a variable to monitor, and the data points represent the values of that variable over time. For example, the CPU usage of a particular EC2 instance is one metric provided by Amazon EC2. The data points themselves can come from any application or business activity from which you collect data.

AWS services send metrics to CloudWatch, and you can send your own custom metrics to CloudWatch. You can add the data points in any order, and at any rate you choose. You can retrieve statistics about those data points as an ordered set of time-series data.

Metrics exist only in the region in which they are created. Metrics cannot be deleted, but they automatically expire after 15 months if no new data is published to them. Data points older than 15 months expire on a rolling basis; as new data points come in, data older than 15 months is dropped.

Metrics are uniquely defined by a name, a namespace, and zero or more dimensions. Each data point has a time stamp, and (optionally) a unit of measure. When you request statistics, the returned data stream is identified by namespace, metric name, dimension, and (optionally) the unit.

For more information, see [View Available Metrics \(p. 26\)](#) and [Publish Custom Metrics \(p. 42\)](#).

Time Stamps

Each metric data point must be marked with a time stamp. The time stamp can be up to two weeks in the past and up to two hours into the future. If you do not provide a time stamp, CloudWatch creates a time stamp for you based on the time the data point was received.

Time stamps are `dateTime` objects, with the complete date plus hours, minutes, and seconds (for example, 2016-10-31T23:59:59Z). For more information, see [dateTime](#). Although it is not required, we recommend that you use Coordinated Universal Time (UTC). When you retrieve statistics from CloudWatch, all times are in UTC.

CloudWatch alarms check metrics based on the current time in UTC. Custom metrics sent to CloudWatch with time stamps other than the current UTC time can cause alarms to display the **Insufficient Data** state or result in delayed alarms.

Metrics Retention

CloudWatch retains metric data as follows:

- Data points with a period of less than 60 seconds are available for 3 hours. These data points are high-resolution custom metrics.
- Data points with a period of 60 seconds (1 minute) are available for 15 days
- Data points with a period of 300 seconds (5 minute) are available for 63 days
- Data points with a period of 3600 seconds (1 hour) are available for 455 days (15 months)

Data points that are initially published with a shorter period are aggregated together for long-term storage. For example, if you collect data using a period of 1 minute, the data remains available for 15 days with 1-minute resolution. After 15 days this data is still available, but is aggregated and is retrievable only with a resolution of 5 minutes. After 63 days, the data is further aggregated and is available with a resolution of 1 hour.

CloudWatch started retaining 5-minute and 1-hour metric data as of 9 July 2016.

Dimensions

A *dimension* is a name/value pair that uniquely identifies a metric. You can assign up to 10 dimensions to a metric.

Every metric has specific characteristics that describe it, and you can think of dimensions as categories for those characteristics. Dimensions help you design a structure for your statistics plan. Because dimensions are part of the unique identifier for a metric, whenever you add a unique name/value pair to one of your metrics, you are creating a new variation of that metric.

AWS services that send data to CloudWatch attach dimensions to each metric. You can use dimensions to filter the results that CloudWatch returns. For example, you can get statistics for a specific EC2 instance by specifying the `InstanceId` dimension when you search for metrics.

For metrics produced by certain AWS services, such as Amazon EC2, CloudWatch can aggregate data across dimensions. For example, search for metrics in the `AWS/EC2` namespace but do not specify any dimensions, CloudWatch aggregates all data for the specified metric to create the statistic that you requested. CloudWatch does not aggregate across dimensions for your custom metrics.

Dimension Combinations

CloudWatch treats each unique combination of dimensions as a separate metric, even if the metrics have the same metric name. You can only retrieve statistics using combinations of dimensions that you specifically published. When you retrieve statistics, specify the same values for the namespace, metric name, and dimension parameters that were used when the metrics were created. You can also specify the start and end times for CloudWatch to use for aggregation.

For example, suppose that you publish four distinct metrics named `ServerStats` in the `DataCenterMetric` namespace with the following properties:

```
Dimensions: Server=Prod, Domain=Frankfurt, Unit: Count, Timestamp: 2016-10-31T12:30:00Z,
Value: 105
Dimensions: Server=Beta, Domain=Frankfurt, Unit: Count, Timestamp: 2016-10-31T12:31:00Z,
Value: 115
Dimensions: Server=Prod, Domain=Rio, Unit: Count, Timestamp: 2016-10-31T12:32:00Z,
Value: 95
Dimensions: Server=Beta, Domain=Rio, Unit: Count, Timestamp: 2016-10-31T12:33:00Z,
Value: 97
```

If you publish only those four metrics, you can retrieve statistics for these combinations of dimensions:

- `Server=Prod,Domain=Frankfurt`

- `Server=Prod,Domain=Rio`
- `Server=Beta,Domain=Frankfurt`
- `Server=Beta,Domain=Rio`

You can't retrieve statistics for the following dimensions or if you specify no dimensions:

- `Server=Prod`
- `Server=Beta`
- `Domain=Frankfurt`
- `Domain=Rio`

Statistics

Statistics are metric data aggregations over specified periods of time. CloudWatch provides statistics based on the metric data points provided by your custom data or provided by other AWS services to CloudWatch. Aggregations are made using the namespace, metric name, dimensions, and the data point unit of measure, within the time period you specify. The following table describes the available statistics.

Statistic	Description
Minimum	The lowest value observed during the specified period. You can use this value to determine low volumes of activity for your application.
Maximum	The highest value observed during the specified period. You can use this value to determine high volumes of activity for your application.
Sum	All values submitted for the matching metric added together. This statistic can be useful for determining the total volume of a metric.
Average	The value of <code>Sum / SampleCount</code> during the specified period. By comparing this statistic with the <code>Minimum</code> and <code>Maximum</code> , you can determine the full scope of a metric and how close the average use is to the <code>Minimum</code> and <code>Maximum</code> . This comparison helps you to know when to increase or decrease your resources as needed.
SampleCount	The count (number) of data points used for the statistical calculation.
pNN.NN	The value of the specified percentile. You can specify any percentile, using up to two decimal places (for example, p95.45). For more information, see Percentiles (p. 7) .

You can add pre-calculated statistics. Instead of data point values, you specify values for `SampleCount`, `Minimum`, `Maximum`, and `Sum` (CloudWatch calculates the average for you). The values you add in this way are aggregated with any other values associated with the matching metric.

Units

Each statistic has a unit of measure. Example units include `Bytes`, `Seconds`, `Count`, and `Percent`. For the complete list of the units that CloudWatch supports, see the [MetricDatum](#) data type in the *Amazon CloudWatch API Reference*.

You can specify a unit when you create a custom metric. If you do not specify a unit, CloudWatch uses `None` as the unit. Units help provide conceptual meaning to your data. Though CloudWatch attaches no significance to a unit internally, other applications can derive semantic information based on the unit.

Metric data points that specify a unit of measure are aggregated separately. When you get statistics without specifying a unit, CloudWatch aggregates all data points of the same unit together. If you have two otherwise identical metrics with different units, two separate data streams are returned, one for each unit.

Periods

A *period* is the length of time associated with a specific Amazon CloudWatch statistic. Each statistic represents an aggregation of the metrics data collected for a specified period of time. Periods are defined in numbers of seconds, and valid values for period are 1, 5, 10, 30, or any multiple of 60. For example, to specify a period of six minutes, use 360 as the period value. You can adjust how the data is aggregated by varying the length of the period. A period can be as short as one second or as long as one day (86,400 seconds). The default value is 60 seconds.

Only custom metrics that you define with a storage resolution of 1 second support sub-minute periods. Even though the option to set a period below 60 is always available in the console, you should select a period that aligns to how the metric is stored. For more information about metrics that support sub-minute periods, see [High-Resolution Metrics \(p. 42\)](#).

When you retrieve statistics, you can specify a period, start time, and end time. These parameters determine the overall length of time associated with the statistics. The default values for the start time and end time get you the last hour's worth of statistics. The values that you specify for the start time and end time determine how many periods CloudWatch returns. For example, retrieving statistics using the default values for the period, start time, and end time returns an aggregated set of statistics for each minute of the previous hour. If you prefer statistics aggregated in ten-minute blocks, specify a period of 600. For statistics aggregated over the entire hour, specify a period of 3600.

Periods are also important for CloudWatch alarms. When you create an alarm to monitor a specific metric, you are asking CloudWatch to compare that metric to the threshold value that you specified. You have extensive control over how CloudWatch makes that comparison. Not only can you specify the period over which the comparison is made, but you can also specify how many evaluation periods are used to arrive at a conclusion. For example, if you specify three evaluation periods, CloudWatch compares a window of three data points. CloudWatch only notifies you if the oldest data point is breaching and the others are breaching or missing. For metrics that are continuously emitted, CloudWatch doesn't notify you until three failures are found.

Aggregation

Amazon CloudWatch aggregates statistics according to the period length that you specify when retrieving statistics. You can publish as many data points as you want with the same or similar time stamps. CloudWatch aggregates them by period length. Aggregated statistics are only available when using detailed monitoring. In addition, Amazon CloudWatch does not aggregate data across regions.

You can publish data points for a metric that share not only the same time stamp, but also the same namespace and dimensions. CloudWatch returns aggregated statistics for those data points. You can also publish multiple data points for the same or different metrics, with any time stamp.

For large datasets, you can insert a pre-aggregated dataset called a *statistic set*. With statistic sets, you give CloudWatch the Min, Max, Sum, and SampleCount for a number of data points. This is commonly used when you need to collect data many times in a minute. For example, suppose you have a metric for the request latency of a webpage. It doesn't make sense to publish data with every webpage hit. We suggest that you collect the latency of all hits to that webpage, aggregate them once a minute, and send that statistic set to CloudWatch.

Amazon CloudWatch doesn't differentiate the source of a metric. If you publish a metric with the same namespace and dimensions from different sources, CloudWatch treats this as a single metric. This can be useful for service metrics in a distributed, scaled system. For example, all the hosts in a web server application could publish identical metrics representing the latency of requests they are processing.

CloudWatch treats these as a single metric, allowing you to get the statistics for minimum, maximum, average, and sum of all requests across your application.

Percentiles

A *percentile* indicates the relative standing of a value in a dataset. For example, the 95th percentile means that 95 percent of the data is lower than this value and 5 percent of the data is higher than this value. Percentiles help you get a better understanding of the distribution of your metric data. You can use percentiles with the following services:

- Amazon EC2
- Amazon RDS
- Kinesis
- Application Load Balancer
- Elastic Load Balancing
- API Gateway

Percentiles are often used to isolate anomalies. In a typical distribution, 95 percent of the data is within two standard deviations from the mean and 99.7 percent of the data is within three standard deviations from the mean. Any data that falls outside three standard deviations is often considered to be an anomaly because it differs so greatly from the average value. For example, suppose that you are monitoring the CPU utilization of your EC2 instances to ensure that your customers have a good experience. If you monitor the average, this can hide anomalies. If you monitor the maximum, a single anomaly can skew the results. Using percentiles, you can monitor the 95th percentile of CPU utilization to check for instances with an unusually heavy load.

You can monitor your system and applications using percentiles as you would use the other CloudWatch statistics (Average, Minimum, Maximum, and Sum). For example, when you create an alarm, you can use percentiles as the statistical function. You can specify the percentile with up to two decimal places (for example, p95.45).

CloudWatch needs raw data points to calculate percentiles. If you publish data using a statistic set instead, you can only retrieve percentile statistics for this data when one of the following conditions is true:

- The SampleCount of the statistic set is 1.
- The Min and the Max of the statistic set are equal.

Alarms

You can use an *alarm* to automatically initiate actions on your behalf. An alarm watches a single metric over a specified time period, and performs one or more specified actions, based on the value of the metric relative to a threshold over time. The action is a notification sent to an Amazon SNS topic or an Auto Scaling policy. You can also add alarms to dashboards.

Alarms invoke actions for sustained state changes only. CloudWatch alarms do not invoke actions simply because they are in a particular state. The state must have changed and been maintained for a specified number of periods.

When creating an alarm, select a period that is greater than or equal to the frequency of the metric to be monitored. For example, basic monitoring for Amazon EC2 provides metrics for your instances every 5 minutes. When setting an alarm on a basic monitoring metric, select a period of at least 300 seconds (5 minutes). Detailed monitoring for Amazon EC2 provides metrics for your instances every 1 minute. When setting an alarm on a detailed monitoring metric, select a period of at least 60 seconds (1 minute).

If you set an alarm on a high-resolution metric, you can specify a high-resolution alarm with a period of 10 seconds or 30 seconds, or you can set a regular alarm with a period of any multiple of 60 seconds. There is a higher charge for high-resolution alarms. For more information about high-resolution metrics, see [Publish Custom Metrics](#) (p. 42).

For more information, see [Creating Amazon CloudWatch Alarms](#) (p. 268) and [Create an Alarm from a Metric on a Graph](#) (p. 41).

CloudWatch Limits

CloudWatch has the following limits:

Resource	Default Limit
Actions	5/alarm. This limit cannot be changed.
Alarms	10/month/customer for free. 5000 per region per account.
API requests	1,000,000/month/customer for free.
Custom metrics	No limit.
DescribeAlarms	9 transactions per second (TPS). The maximum number of operation requests you can make per second without being throttled. You can request a limit increase .
Dimensions	10/metric. This limit cannot be changed.
GetMetricStatistics	400 transactions per second (TPS). The maximum number of operation requests you can make per second without being throttled. You can request a limit increase .
ListMetrics	25 transactions per second (TPS). The maximum number of operation requests you can make per second without being throttled. You can request a limit increase .
Metric data	15 months. This limit cannot be changed.
MetricDatum items	20/ PutMetricData request. A MetricDatum object can contain a single value or a StatisticSet object representing many values. This limit cannot be changed.
Metrics	10/month/customer for free.
Period	Maximum value is one day (86,400 seconds). This limit cannot be changed.
PutMetricAlarm request	3 transactions per second (TPS). The maximum number of operation requests you can make per second without being throttled. You can request a limit increase .

Resource	Default Limit
PutMetricData request	40 KB for HTTP POST requests. PutMetricData can handle 150 transactions per second (TPS), which is the maximum number of operation requests you can make per second without being throttled. You can request a limit increase .
Amazon SNS email notifications	1,000/month/customer for free.

Amazon CloudWatch Resources

The following related resources can help you as you work with this service.

Resource	Description
Amazon CloudWatch FAQs	The FAQ covers the top questions developers have asked about this product.
Release notes	The release notes give a high-level overview of the current release. They specifically note any new features, corrections, and known issues.
AWS Developer Resource Center	A central starting point to find documentation, code examples, release notes, and other information to help you build innovative applications with AWS.
AWS Management Console	The console allows you to perform most of the functions of Amazon CloudWatch and various other AWS offerings without programming.
Amazon CloudWatch Discussion Forums	Community-based forum for developers to discuss technical questions related to Amazon CloudWatch.
AWS Support	The hub for creating and managing your AWS Support cases. Also includes links to other helpful resources, such as forums, technical FAQs, service health status, and AWS Trusted Advisor.
Amazon CloudWatch product information	The primary webpage for information about Amazon CloudWatch.
Contact Us	A central contact point for inquiries concerning AWS billing, account, events, abuse, etc.

Getting Set Up

To use Amazon CloudWatch you need an AWS account. Your AWS account allows you to use services (for example, Amazon EC2) to generate metrics that you can view in the CloudWatch console, a point-and-click web-based interface. In addition, you can install and configure the AWS command line interface (CLI).

Sign Up for Amazon Web Services (AWS)

When you create an AWS account, we automatically sign up your account for all AWS services. You pay only for the services that you use.

If you have an AWS account already, skip to the next step. If you don't have an AWS account, use the following procedure to create one.

To sign up for an AWS account

1. Open <https://aws.amazon.com/>, and then choose **Create an AWS Account**.

Note

This might be unavailable in your browser if you previously signed into the AWS Management Console. In that case, choose **Sign in to a different account**, and then choose **Create a new AWS account**.

2. Follow the online instructions.

Part of the sign-up procedure involves receiving a phone call and entering a PIN using the phone keypad.

Sign in to the Amazon CloudWatch Console

To sign in to the Amazon CloudWatch console

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. If necessary, use the navigation bar to change the region to the region where you have your AWS resources.
3. Even if this is the first time you are using the CloudWatch console, **Your Metrics** could already report metrics, because you have used a AWS product that automatically pushes metrics to Amazon CloudWatch for free. Other AWS products require that you enable metrics.

If you do not have any alarms, the **Your Alarms** section will have a **Create Alarm** button.

Set Up the AWS CLI

You can use the AWS CLI or the Amazon CloudWatch CLI to perform CloudWatch commands. Note that the AWS CLI replaces the CloudWatch CLI; we include new CloudWatch features only in the AWS CLI.

For information about how to install and configure the AWS CLI, see [Getting Set Up with the AWS Command Line Interface](#) in the *AWS Command Line Interface User Guide*.

For information about how to install and configure the Amazon CloudWatch CLI, see [Set Up the Command Line Interface](#) in the *Amazon CloudWatch CLI Reference*.

Getting Started with Amazon CloudWatch

The following scenarios show you how to use Amazon CloudWatch. In the first scenario, you use the CloudWatch console to create a billing alarm that tracks your AWS usage and lets you know when you have exceeded a certain spending threshold. In the second, more advanced scenario, you use the AWS command line interface (CLI) to publish a single metric for a hypothetical application named *GetStarted*.

Scenarios

- [Monitor Your Estimated Charges \(p. 12\)](#)
- [Publish Metrics \(p. 15\)](#)

Scenario: Monitor Your Estimated Charges Using CloudWatch

In this scenario, you create an Amazon CloudWatch alarm to monitor your estimated charges. When you enable the monitoring of estimated charges for your AWS account, the estimated charges are calculated and sent several times daily to CloudWatch as metric data.

Billing metric data is stored in the US East (N. Virginia) Region and reflects worldwide charges. This data includes the estimated charges for every service in AWS that you use, as well as the estimated overall total of your AWS charges.

You can choose to receive alerts by email when charges have exceeded a certain threshold. These alerts are triggered by CloudWatch and messages are sent using Amazon Simple Notification Service (Amazon SNS).

Tasks

- [Step 1: Enable Billing Alerts \(p. 12\)](#)
- [Step 2: Create a Billing Alarm \(p. 13\)](#)
- [Step 3: Check the Alarm Status \(p. 14\)](#)
- [Step 4: Edit a Billing Alarm \(p. 14\)](#)
- [Step 5: Delete a Billing Alarm \(p. 15\)](#)

Step 1: Enable Billing Alerts

Before you can create an alarm for your estimated charges, you must enable billing alerts, so that you can monitor your estimated AWS charges and create an alarm using billing metric data. After you enable billing alerts, you cannot disable data collection, but you can delete any billing alarms you created.

After you enable billing alerts for the first time, it takes about 15 minutes before you can view billing data and set billing alarms.

Requirements

- You must be signed in using root account credentials; IAM users cannot enable billing alerts for your AWS account.
- For consolidated billing accounts, billing data for each linked account can be found by logging in as the paying account. You can view billing data for total estimated charges and estimated charges by service for each linked account as well as for the consolidated account.

To enable monitoring of your estimated charges

1. Open the Billing and Cost Management console at <https://console.aws.amazon.com/billing/home?#>.
2. In the navigation pane, choose **Preferences**.
3. Select **Receive Billing Alerts**.

Dashboard Bills Cost Explorer Budgets Reports Cost Allocation Tags Payment Methods Payment History Consolidated Billing **Preferences** Credits Tax Settings DevPay

Preferences

☐ **Receive PDF Invoice By Email**
Turn on this feature to receive a PDF version of your invoice by email. Invoices are generally available within the first three days of the month.

☒ **Receive Billing Alerts**
Turn on this feature to monitor your AWS usage charges and recurring fees automatically, making it easier to track and manage your spending on AWS. You can set up billing alerts to receive email notifications when your charges reach a specified threshold. Once enabled, this preference cannot be disabled. [Manage Billing Alerts](#)

☐ **Receive Billing Reports**
Turn on this feature to receive ongoing reports of your AWS charges once or more daily. AWS delivers these reports to the Amazon S3 bucket that you specify where indicated below. For consolidated billing customers, AWS generates reports only for paying accounts. Linked accounts cannot sign up for billing reports.

Save to S3 Bucket:

4. Choose **Save preferences**.

Step 2: Create a Billing Alarm

After you've enabled billing alerts, you can create a billing alarm. In this scenario, you create an alarm that sends an email message when your estimated charges for AWS exceed a specified threshold.

Note

This procedure uses the simple options. To use the advanced options, see [Create a Billing Alarm \(p. 286\)](#) in *Create a Billing Alarm to Monitor Your Estimated AWS Charges*.

To create a billing alarm

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. If necessary, change the region to US East (N. Virginia). Billing metric data is stored in this region and reflects worldwide charges.
3. In the navigation pane, choose **Alarms, Billing**.
4. For **Whenever my total AWS charges for the month exceed**, specify the monetary amount (for example, 200) that must be exceeded to trigger the alarm and send an email notification.

Tip

Under **Alarm Preview**, there is an estimate of your charges that you can use to set an appropriate amount.

Create Alarm

Billing Alarm

You can create a billing alarm to receive e-mail alerts when your AWS charges exceed a threshold you choose. Simply:

1. Enter a spending threshold
2. Provide an email address
3. Check your inbox for a confirmation email and click the link provided

When my total AWS charges for the month exceed: \$ USD

send a notification to: [New list](#)

Reminder: for each address you add, you will receive an email from AWS with the subject "AWS Notification - Subscription Confirmation". Click the link provided in the message to confirm that AWS may deliver alerts to that address.

[showing simple options](#) | [show advanced](#)

Alarm Preview

This alarm will trigger when the blue line goes above the red line

EstimatedCharges >= 200

More resources

- [AWS Billing console](#)
- [Getting started with billing alarms](#)
- [More help with billing alarms](#)
- [AWS Billing FAQs](#)

[Cancel](#) [Previous](#) [Next](#) [Create Alarm](#)

5. For **send a notification to**, choose an existing notification list or create a new one.

To create a list, choose **New list** and type a comma-separated list of email addresses to be notified when the alarm changes to the ALARM state. Each email address will be sent a subscription confirmation email. The recipient must confirm the subscription before notifications can be sent to the email address.

6. Choose **Create Alarm**.

Step 3: Check the Alarm Status

Now, check the status of the billing alarm that you just created.

To check the alarm status

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. If necessary, change the region to US East (N. Virginia). Billing metric data is stored in this region and reflects worldwide charges.
3. In the navigation pane, choose **Alarms, Billing**.
4. Select the check box next to the alarm. Note that until the subscription is confirmed, it is shown as "Pending confirmation". After the subscription is confirmed, refresh the console to show the updated status.

Step 4: Edit a Billing Alarm

Let's say that you want to increase the amount money you spend with AWS each month from \$200 to \$400. You can edit your existing billing alarm and increase the monetary amount that must be exceeded before the alarm is triggered.

To edit a billing alarm

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. If necessary, change the region to US East (N. Virginia). Billing metric data is stored in this region and reflects worldwide charges.
3. In the navigation pane, choose **Alarms, Billing**.
4. Select the check box next to the alarm and then choose **Actions, Modify**.
5. For **Whenever my total AWS charges for the month exceed**, specify the new amount that must be exceeded to trigger the alarm and send an email notification.
6. Choose **Save Changes**.

Step 5: Delete a Billing Alarm

You can delete your billing alarm if you no longer need it.

To delete a billing alarm

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. If necessary, change the region to US East (N. Virginia). Billing metric data is stored in this region and reflects worldwide charges.
3. In the navigation pane, choose **Alarms, Billing**.
4. Select the check box next to the alarm and then choose **Actions, Delete**.
5. When prompted for confirmation, choose **Yes, Delete**.

Scenario: Publish Metrics to CloudWatch

In this scenario, you'll use the AWS Command Line Interface (AWS CLI) to publish a single metric for a hypothetical application named *GetStarted*. If you haven't already installed and configured the AWS CLI, see [Getting Set Up with the AWS Command Line Interface](#) in the *AWS Command Line Interface User Guide*.

Tasks

- [Step 1: Define the Data Configuration](#) (p. 15)
- [Step 2: Add Metrics to CloudWatch](#) (p. 16)
- [Step 3: Get Statistics from CloudWatch](#) (p. 17)
- [Step 4: View Graphs with the Console](#) (p. 17)

Step 1: Define the Data Configuration

In this scenario, you'll publish data points that track the request latency for the application. Choose names for your metric and namespace that make sense to you. For this example, name the metric *RequestLatency* and place all of the data points into the *GetStarted* namespace.

You'll publish several data points that collectively represent three hours of latency data. The raw data comprises fifteen request latency readings distributed over three hours. Each reading is in milliseconds:

- Hour one: 87, 51, 125, 235

- Hour two: 121, 113, 189, 65, 89
- Hour three: 100, 47, 133, 98, 100, 328

You can publish data to CloudWatch as single data points or as an aggregated set of data points called a *statistic set*. You can aggregate metrics to a granularity as low as one minute. You can publish the aggregated data points to CloudWatch as a set of statistics with four predefined keys: `Sum`, `Minimum`, `Maximum`, and `SampleCount`.

You'll publish the data points from hour one as single data points. For the data from hours two and three, you'll aggregate the data points and publish a statistic set for each hour. The key values are shown in the following table.

Hour	Raw Data	Sum	Minimum	Maximum	SampleCount
1	87				
1	51				
1	125				
1	235				
2	121, 113, 189, 65, 89	577	65	189	5
3	100, 47, 133, 98, 100, 328	806	47	328	6

Step 2: Add Metrics to CloudWatch

After you have defined your data configuration, you are ready to add data.

To publish data points to CloudWatch

1. At a command prompt, run the following [put-metric-data](#) commands to add data for the first hour. Replace the example time stamp with a time stamp that is two hours in the past, in Universal Coordinated Time (UTC).

```
aws cloudwatch put-metric-data --metric-name RequestLatency --namespace GetStarted \
--timestamp 2016-10-14T20:30:00Z --value 87 --unit Milliseconds
aws cloudwatch put-metric-data --metric-name RequestLatency --namespace GetStarted \
--timestamp 2016-10-14T20:30:00Z --value 51 --unit Milliseconds
aws cloudwatch put-metric-data --metric-name RequestLatency --namespace GetStarted \
--timestamp 2016-10-14T20:30:00Z --value 125 --unit Milliseconds
aws cloudwatch put-metric-data --metric-name RequestLatency --namespace GetStarted \
--timestamp 2016-10-14T20:30:00Z --value 235 --unit Milliseconds
```

2. Add data for the second hour, using a time stamp that is one hour later than the first hour.

```
aws cloudwatch put-metric-data --metric-name RequestLatency --namespace GetStarted \
--timestamp 2016-10-14T21:30:00Z --statistic-values
Sum=577,Minimum=65,Maximum=189,SampleCount=5 --unit Milliseconds
```

3. Add data for the third hour, omitting the time stamp to default to the current time.

```
aws cloudwatch put-metric-data --metric-name RequestLatency --namespace GetStarted \
--statistic-values Sum=806,Minimum=47,Maximum=328,SampleCount=6 --unit Milliseconds
```

Step 3: Get Statistics from CloudWatch

Now that you have published metrics to CloudWatch, you can retrieve statistics based on those metrics using the `get-metric-statistics` command as follows. Be sure to specify `--start-time` and `--end-time` far enough in the past to cover the earliest time stamp that you published.

```
aws cloudwatch get-metric-statistics --namespace GetStarted --metric-name RequestLatency --
statistics Average \
--start-time 2016-10-14T00:00:00Z --end-time 2016-10-15T00:00:00Z --period 60
```

The following is example output:

```
{
  "Datapoints": [],
  "Label": "Request:Latency"
}
```

Step 4: View Graphs with the Console

After you have published metrics to CloudWatch, you can use the CloudWatch console to view statistical graphs.

To view graphs of your statistics on the console

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the **Navigation** pane, choose **Metrics**.
3. In the **All metrics** tab, in the search box, type **RequestLatency** and press Enter.
4. Select the check box for the **RequestLatency** metric. A graph of the metric data is displayed in the upper pane.

For more information, see [Graph Metrics \(p. 37\)](#).

Using Amazon CloudWatch Dashboards

Amazon CloudWatch dashboards are customizable home pages in the CloudWatch console that you can use to monitor your resources in a single view, even those resources that are spread across different regions. You can use CloudWatch dashboards to create customized views of the metrics and alarms for your AWS resources.

With dashboards, you can create the following:

- A single view for selected metrics and alarms to help you assess the health of your resources and applications across one or more regions. You can select the color used for each metric on each graph, so that you can easily track the same metric across multiple graphs.
- An operational playbook that provides guidance for team members during operational events about how to respond to specific incidents.
- A common view of critical resource and application measurements that can be shared by team members for faster communication flow during operational events.

You can create dashboards by using the console, the AWS CLI, or by using the `PutDashboard` API.

- [Change the Refresh Interval for the CloudWatch Dashboard \(p. 24\)](#)
- [Change the Time Range or Time Zone Format of a CloudWatch Dashboard \(p. 25\)](#)

Create a CloudWatch Dashboard

To get started with CloudWatch dashboards, you must first create a dashboard. You can create multiple dashboards. You can have up to 500 dashboards in your AWS account. All dashboards are global, not region-specific.

The steps in this section are for creating a dashboard using the console. You can also create a dashboard with the `PutDashboard` API, which uses a JSON string to define the dashboard contents. To create a dashboard using `PutDashboard` and base this dashboard on an existing dashboard, choose **Actions**,

View/edit source to display and copy the JSON string of a current dashboard to use for your new dashboard.

For more information about creating a dashboard using the API, see [PutDashboard](#) in the Amazon CloudWatch API Reference.

To create a dashboard using the console

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Dashboards**, **Create dashboard**.
3. In the **Create new dashboard** dialog box, type a name for the dashboard and choose **Create dashboard**.
4. Do one of the following in the **Add to this dashboard** dialog box:
 - To add a graph to your dashboard, choose **Line** or **Stacked area** and then choose **Configure**. In the **Add metric graph** dialog box, select the metrics to graph and choose **Create widget**.
 - To add a number displaying a metric to the dashboard, choose **Number**, **Configure**. In the **Add metric graph** dialog box, select the metrics to graph and choose **Create widget**.
 - To add a text block to your dashboard, choose **Text**, **Configure**. In the **New text widget** dialog box, for **Markdown**, add and format your text using [Markdown](#), and then choose **Create widget**.
5. Optionally, choose **Add widget** and repeat step 4 to add another widget to the dashboard. You can repeat this step as much as you want.
6. Choose **Save dashboard**.

Add or Remove a Graph from a CloudWatch Dashboard

You can add graphs containing one or more metrics to your dashboard for the resources you monitor. You can remove the graphs when they're no longer needed.

To add a graph to a dashboard

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Dashboards** and select a dashboard.
3. Choose **Add widget**.
4. Choose either **Line** or **Stacked area**, and then choose **Configure**.
5. In the **All metrics** tab, select the metrics to graph.
6. (Optional) As you choose metrics to graph, you can change their color on the graph. To do so, choose **Graphed metrics** and select the color square next to the metric to display a color picker box. Choose another color square in the color picker, and then click outside the color picker to see your new color on the graph. Alternatively, in the color picker, you can type the six-digit standard HTML hex color code for the color you want and press ENTER.
7. Horizontal annotations can help dashboard users quickly see when a metric has spiked to a certain level, or whether the metric is within a predefined range. To add a horizontal annotation, choose **Graph options**, **Add horizontal annotation**:
 - a. For **Label**, type a label for the annotation.
 - b. For **Value**, type the metric value where the horizontal annotation appears.
 - c. For **Fill**, specify whether to use fill shading with this annotation. For example, choose **Above** or **Below** for the corresponding area to be filled. If you specify **Between**, another **Value** field appears, and the area of the graph between the two values is filled.

- d. For **Axis**, specify whether the numbers in `Value` refer to the metric associated with the left Y-axis or the right Y-axis, if the graph includes multiple metrics.

You can change the fill color of an annotation by choosing the color square in the left column of the annotation.

Repeat these steps to add multiple horizontal annotations to the same graph.

To hide an annotation, clear the checkbox in the left column for that annotation.

To delete an annotation, choose **x** in the **Actions** column.

8. (Optional) To view more information about the metric being graphed, hover over the legend.
9. (Optional) To change the widget type, hover over the title area of the graph and choose **Widget actions**, **Widget type**.
10. Choose **Create widget**.
11. Choose **Save dashboard**.

To remove a graph from a dashboard

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Dashboards** and select a dashboard.
3. Hover over the title of the graph and choose **Widget actions**, **Delete**.
4. Choose **Save dashboard**. If you attempt to navigate away from the dashboard before you save your changes, you are prompted to either save or discard your changes.

Move or Resize a Graph on a CloudWatch Dashboard

You can arrange and resize graphs on your CloudWatch dashboard.

To move a graph on a dashboard

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Dashboards** and select a dashboard.
3. Hover over the title of the graph until the selection icon appears, and then select and drag the graph to a new location on the dashboard.
4. Choose **Save dashboard**.

To resize a graph

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Dashboards** and select a dashboard.
3. To increase or decrease the size, hover over the graph and drag the lower right corner of the graph.
4. Choose **Save dashboard**.

To enlarge a graph temporarily

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Dashboards** and select a dashboard.

3. Select the graph. Alternatively, hover over the title of the graph and choose **Widget actions**, **Enlarge**.

Edit a Graph on a CloudWatch Dashboard

You can edit a graph to change the title, statistic, or period, or to add or remove metrics. If you have multiple metrics displayed on a graph, you can reduce clutter by temporarily hiding the metrics that don't interest you.

To edit a graph on a dashboard

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Dashboards** and select a dashboard.
3. Hover over the title of the graph and choose **Widget actions**, **Edit**.
4. To change the graph's title, select the title, type a new title, and press ENTER.
5. In the lower half of the screen, in the **Graphed metrics** tab, you can change the colors, statistic, or period:
 - a. To change the color of one of the lines, select the color square next to the metric to display a color picker box. Choose another color in the color picker, and then click outside the color picker to see your new color on the graph. Alternatively, in the color picker, you can type the six-digit HTML hex color code for the color you want and press ENTER.
 - b. To change the statistic, choose **Statistic** in the lower half of the window, and choose the new statistic you want.
 - c. To change the time period, which is next to **Statistic** in the lower half of the window, choose **Period**, and then select another value. This new setting is used on the dashboard only if the period setting of the dashboard itself is set to **Auto**. Otherwise, the period setting of the dashboard overrides the period setting for individual widgets.
6. To add or edit horizontal annotations, choose **Graph options**:
 - a. To add a horizontal annotation, choose **Add horizontal annotation**.
 - b. For **Label**, type a label for the annotation.
 - c. For **Value**, type the metric value where the horizontal annotation appears.
 - d. For **Fill**, specify how to use fill shading with this annotation. For example, choose **Above** or **Below** for the corresponding area to be filled. If you specify **Between**, another **Value** field appears, and the area of the graph between the two values is filled.

You can change the fill color of an annotation by choosing the color square in the left column of the annotation.
 - e. For **Axis**, specify whether the numbers in **Value** refer to the metric associated with the left Y-axis or the right Y-axis, if the graph includes multiple metrics.

Repeat these steps to add multiple horizontal annotations to the same graph.

To hide an annotation, clear the check box in the left column for that annotation.

To delete an annotation, click the **x** in the **Actions** column.

7. When you're finished with your changes, choose **Update widget**.

To temporarily hide metrics on a graph on a dashboard

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.

2. In the navigation pane, choose **Dashboards** and select a dashboard.
3. In the graph's footer, hover over the colored square in the legend. When it changes to an X, click it.
4. To restore the metric, choose the grayed out square and metric name.

Rename a Graph on a CloudWatch Dashboard

You can change the default name that CloudWatch assigns to a graph on your dashboard.

To rename a graph on a dashboard

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Dashboards** and select a dashboard.
3. Hover over the title of the graph and choose **Widget actions, Edit**.
4. On the **Edit graph** screen, near the top, choose the title of the graph.
5. For **Title**, type a new name, choose **Ok** (check mark), and then in the lower-right corner of the **Edit graph** screen, choose **Update widget**.

Add or Remove a Text Widget from a CloudWatch Dashboard

A text widget contains a block of text in [Markdown](#) format. You can add, edit, or remove text widgets from your CloudWatch dashboard.

To add a text widget to a dashboard

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Dashboards** and select a dashboard.
3. Choose **Add widget**.
4. Choose **Text, Configure**.
5. For **Markdown**, add and format your text using [Markdown](#), and then choose **Create widget**.
6. Choose **Save dashboard**.

To edit a text widget on a dashboard

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Dashboards** and select a dashboard.
3. Hover over the upper-right corner of the text block, and then choose **Widget actions, Edit**.
4. Update the text as needed, and then choose **Update widget**.
5. Choose **Save dashboard**.

To remove a text widget from a dashboard

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Dashboards** and select a dashboard.
3. Hover over the upper-right corner of the text block and choose **Widget actions, Delete**.

4. Choose **Save dashboard**.

Add or Remove an Alarm from a CloudWatch Dashboard

You can add alarms that you have created to your dashboard. When an alarm is on a dashboard, it turns red when it is in the `ALARM` state.

To add an alarm to a dashboard

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Alarms**, select the alarm to add, and then choose **Add to Dashboard**.
3. Select a dashboard, choose a widget type (**Line**, **Stacked area**, or **Number**), and then choose **Add to dashboard**.
4. To see your alarm on the dashboard, choose **Dashboards** in the navigation pane and select the dashboard.
5. (Optional) To temporarily make an alarm graph larger, select the graph.
6. (Optional) To change the widget type, hover over the title of the graph and choose **Widget actions**, **Widget type**.

To remove an alarm from a dashboard

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Dashboards** and select a dashboard.
3. Hover over the title of the graph and choose **Widget actions**, **Delete**.
4. Choose **Save dashboard**. If you attempt to navigate away from the dashboard before you save your changes, you are prompted to either save or discard your changes.

Monitor Resources in Multiple Regions Using a CloudWatch Dashboard

You can monitor AWS resources in multiple regions using a single CloudWatch dashboard. For example, you can create a dashboard that shows CPU utilization for an EC2 instance located in the `us-west-2` region with your billing metrics, which are located in the `us-east-1` region.

To monitor resources in multiple regions in one dashboard

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Metrics**.
3. In the navigation bar, select a region.
4. Select the metrics to add to your dashboard.
5. For **Actions**, choose **Add to dashboard**.
6. For **Add to**, type a name for the new dashboard and choose **Add to dashboard**.

Alternatively, to add to an existing dashboard, choose **Existing dashboard**, select a dashboard, and then choose **Add to dashboard**.

7. To add metrics from another region, select the next region and repeat these steps.
8. Choose **Save dashboard**.

Link and Unlink Graphs on a CloudWatch Dashboard

You can link the graphs on your dashboard together, so that when you zoom in or zoom out on one graph, the other graphs zoom in or zoom out at the same time. You can unlink graphs to limit zoom to one graph.

To link the graphs on a dashboard

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Dashboards** and select a dashboard.
3. Choose **Actions**, **Link graphs**.

To unlink the graphs on a dashboard

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Dashboards** and select a dashboard.
3. Clear **Actions**, **Link graphs**.

Add a Dashboard to Your Favorites List

You can add a CloudWatch dashboard to a list of favorite dashboards, to help you find it quickly. The **Favorites** list appears at the bottom of the navigation pane.

To add a dashboard to the Favorites list

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Dashboards**.
3. Select the star symbol next to the dashboard to add.

Change the Refresh Interval for the CloudWatch Dashboard

You can change how often the data on your CloudWatch dashboard is refreshed or set it to automatically refresh.

To change the dashboard refresh interval

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Dashboards** and select a dashboard.
3. On the **Refresh options** menu (upper right corner), choose **10 Seconds**, **1 Minute**, **2 Minutes**, **5 Minutes**, or **15 Minutes**.

To automatically refresh the dashboard

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Dashboards** and select a dashboard.
3. Choose **Refresh options, Auto refresh**.

Change the Time Range or Time Zone Format of a CloudWatch Dashboard

You can change the time range to display dashboard data over minutes, hours, days, or weeks. You can also change the time format to display dashboard data in UTC or local time.

Note

If you create a dashboard with graphs that contain close to 100 or more high-resolution metrics, we recommend that you set the time range to no longer than one hour, to ensure good dashboard performance. For more information about high-resolution metrics, see [High-Resolution Metrics \(p. 42\)](#).

To change the dashboard time range

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Dashboards** and select a dashboard.
3. Do one of the following:
 - Select one of the predefined ranges shown, which span from 1 hour to 1 week: 1h, 3h, 12h, 1d, 3d, or 1w.
 - Choose **custom, Relative**. Select one of the predefined ranges, which span from 1 minute to 15 months.
 - Choose **custom, Absolute**. Use the calendar picker or the text fields to specify the time range.

Note

When you change the time range of a graph while the aggregation period is set to **Auto**, CloudWatch may change the period. To manually set the period, choose **Actions** and select a new value for **Period**.

To change the dashboard time format

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Dashboards** and select a dashboard.
3. Choose **custom**.
4. From the upper corner, choose **UTC** or **Local timezone**.

Using Amazon CloudWatch Metrics

Metrics are data about the performance of your systems. By default, several services provide free metrics for resources (such as Amazon EC2 instances, Amazon EBS volumes, and Amazon RDS DB instances). You can also enable detailed monitoring some resources, such as your Amazon EC2 instances, or publish your own application metrics. Amazon CloudWatch can load all the metrics in your account (both AWS resource metrics and application metrics that you provide) for search, graphing, and alarms.

Metric data is kept for a period of 15 months, enabling you to view both up-to-the-minute data and historical data.

Contents

- [View Available Metrics \(p. 26\)](#)
- [Search for Available Metrics \(p. 29\)](#)
- [Get Statistics for a Metric \(p. 29\)](#)
- [Graph Metrics \(p. 37\)](#)
- [Publish Custom Metrics \(p. 42\)](#)

View Available Metrics

Metrics are grouped first by namespace, and then by the various dimension combinations within each namespace. For example, you can view all EC2 metrics, EC2 metrics grouped by instance, or EC2 metrics grouped by Auto Scaling group.

Only the AWS services that you're using send metrics to Amazon CloudWatch.

To view available metrics by namespace and dimension using the console

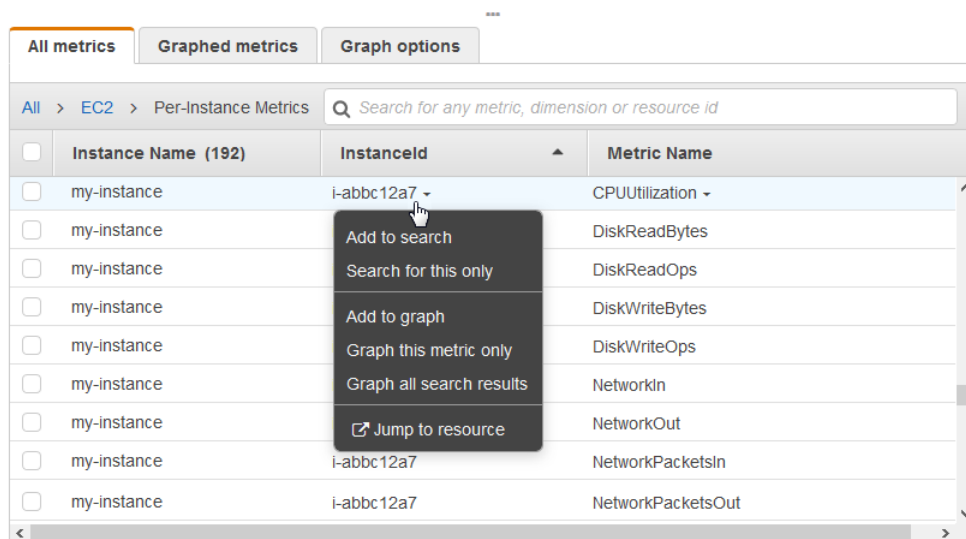

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Metrics**.
3. Select a metric namespace (for example, EC2).

4. Select a metric dimension (for example, Per-Instance Metrics).

5. The **All metrics** tab displays all metrics for that dimension in the namespace. You can do the following:
 - a. To sort the table, use the column heading.
 - b. To graph a metric, select the check box next to the metric. To select all metrics, select the check box in the heading row of the table.
 - c. To filter by resource, choose the resource ID and then choose **Add to search**.
 - d. To filter by metric, choose the metric name and then choose **Add to search**.

To view available metrics by namespace, dimension, or metric using the AWS CLI

Use the `list-metrics` command to list CloudWatch metrics. For a list of all service namespaces, see [AWS Namespaces \(p. 98\)](#). For lists of the metrics and dimensions for each service, see [Amazon CloudWatch Metrics and Dimensions Reference \(p. 97\)](#).

The following example specifies the `AWS/EC2` namespace to view all the metrics for Amazon EC2:

```
aws cloudwatch list-metrics --namespace AWS/EC2
```

The following is example output:

```
{
  "Metrics" : [
    ...
    {
      "Namespace": "AWS/EC2",
      "Dimensions": [
        {
          "Name": "InstanceId",
          "Value": "i-1234567890abcdef0"
        }
      ],
      "MetricName": "NetworkOut"
    },
    {
      "Namespace": "AWS/EC2",
      "Dimensions": [
        {
          "Name": "InstanceId",
          "Value": "i-1234567890abcdef0"
        }
      ],
      "MetricName": "CPUUtilization"
    },
    {
      "Namespace": "AWS/EC2",
      "Dimensions": [
        {
          "Name": "InstanceId",
          "Value": "i-1234567890abcdef0"
        }
      ],
      "MetricName": "NetworkIn"
    },
    ...
  ]
}
```

To list all the available metrics for a specified resource

The following example specifies the AWS/EC2 namespace and the InstanceId dimension to view the results for the specified instance only.

```
aws cloudwatch list-metrics --namespace AWS/EC2 --dimensions
Name=InstanceId,Value=i-1234567890abcdef0
```

To list a metric for all resources

The following example specifies the AWS/EC2 namespace and a metric name to view the results for the specified metric only.

```
aws cloudwatch list-metrics --namespace AWS/EC2 --metric-name CPUUtilization
```

Search for Available Metrics

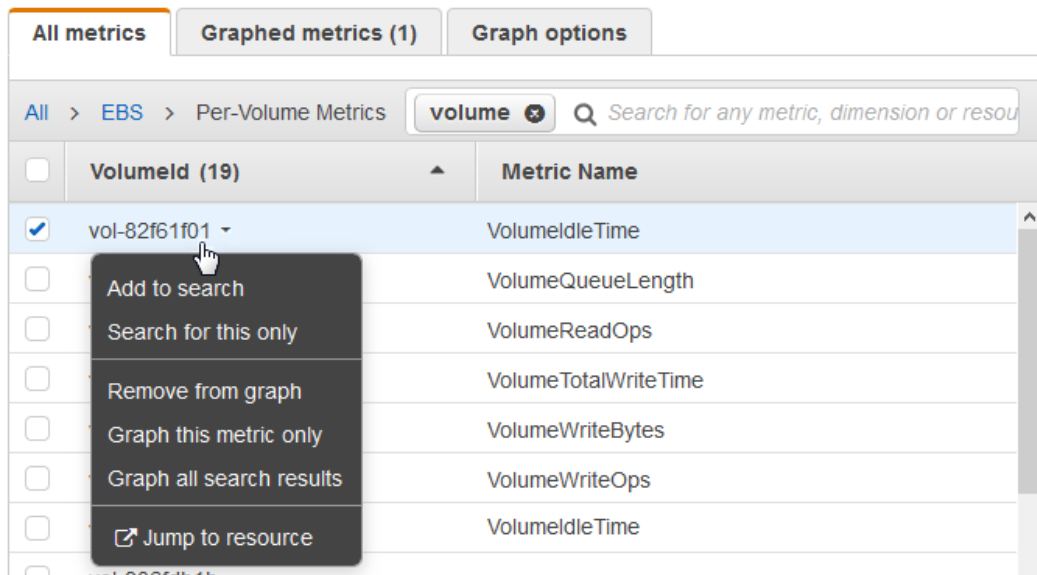

You can search within all the metrics in your account using targeted search terms. Metrics are returned that have matching results within their namespace, metric name, or dimensions.

To search for available metrics in CloudWatch

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Metrics**.
3. In the search field on the **All metrics** tab, type a search term, such as a metric name, service name, or resource name, and press Enter. This shows you all the namespaces with metrics with this search term.

For example, if you search for **volume**, this shows the namespaces that contain metrics with this term in their name.

4. Select a namespace with results for your search to view the metrics. You can do the following:
 - a. To graph one or more metrics, select the check box next to each metric. To select all metrics, select the check box in the heading row of the table.
 - b. To view one of the resources in its console, choose the resource ID and then choose **Jump to resource**.
 - c. To view help for a metric, select the metric name and choose **What is this?**

Get Statistics for a Metric

The following examples show you how to get statistics for the CloudWatch metrics for your resources, such as your EC2 instances.

Examples

- [Get Statistics for a Specific Resource \(p. 30\)](#)
- [Aggregate Statistics Across Resources \(p. 33\)](#)

- [Aggregate Statistics by Auto Scaling Group](#) (p. 34)
- [Aggregate Statistics by Amazon Machine Image \(AMI\)](#) (p. 36)

Get Statistics for a Specific Resource

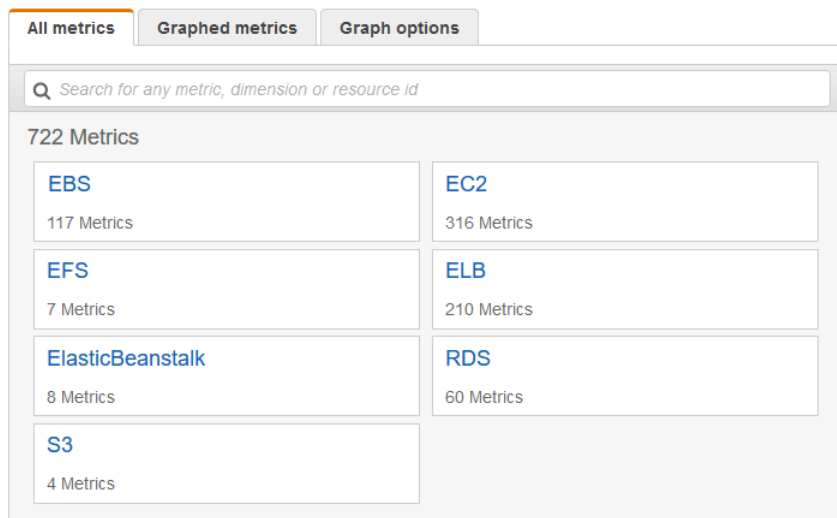

The following example shows you how to determine the maximum CPU utilization of a specific EC2 instance.

Requirements

- You must have the ID of the instance. You can get the instance ID using the Amazon EC2 console or the [describe-instances](#) command.
- By default, basic monitoring is enabled, but you can enable detailed monitoring. For more information, see [Enable or Disable Detailed Monitoring for Your Instances](#) in the *Amazon EC2 User Guide for Linux Instances*.

To display the average CPU utilization for a specific instance using the console

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Metrics**.
3. Select the EC2 metric namespace.

4. Select the Per-Instance Metrics dimension.

- In the search field, type **CPUUtilization** and press Enter. Select the row for the specific instance, which displays a graph for the **CPUUtilization** metric for the instance. To change the name of the graph, choose the pencil icon. To change the time range, select one of the predefined values or choose **custom**.

- To change the statistic, choose the **Graphed metrics** tab. Choose the column heading or an individual value, and then choose one of the statistics or predefined percentiles, or specify a custom percentile (for example, p95.45).

- To change the period, choose the **Graphed metrics** tab. Choose the column heading or an individual value, and then choose a different value.

To get the CPU utilization per EC2 instance using the AWS CLI

Use the [get-metric-statistics](#) command as follows to get the **CPUUtilization** metric for the specified instance:

```
aws cloudwatch get-metric-statistics --namespace AWS/EC2 --metric-name CPUUtilization \
--dimensions Name=InstanceId,Value=i-1234567890abcde0 --statistics Maximum \
--start-time 2016-10-18T23:18:00 --end-time 2016-10-19T23:18:00 --period 360
```

The returned statistics are six-minute values for the requested 24-hour time interval. Each value represents the maximum CPU utilization percentage for the specified instance for a particular six-minute time period. The data points are not returned in chronological order. The following shows the beginning of the example output (the full output includes data points for every 6 minutes of the 24-hour period):

```
{
  "Datapoints": [
    {
      "Timestamp": "2016-10-19T00:18:00Z",
      "Maximum": 0.33000000000000002,
      "Unit": "Percent"
    },
    {
      "Timestamp": "2016-10-19T03:18:00Z",
      "Maximum": 99.670000000000002,
      "Unit": "Percent"
    },
    {
      "Timestamp": "2016-10-19T07:18:00Z",
      "Maximum": 0.34000000000000002,
      "Unit": "Percent"
    },
    ...
  ],
  "Label": "CPUUtilization"
}
```

Aggregate Statistics Across Resources

You can aggregate the metrics for AWS resources across multiple resources. Amazon CloudWatch cannot aggregate data across regions. Metrics are completely separate between regions.

For example, you can aggregate statistics for your EC2 instances that have detailed monitoring enabled. Instances that use basic monitoring are not included. Therefore, you must enable detailed monitoring (at an additional charge), which provides data in 1-minute periods. For more information, see [Enable or Disable Detailed Monitoring for Your Instances](#) in the *Amazon EC2 User Guide for Linux Instances*.

This example shows you how to get the average CPU usage for your EC2 instances. Because no dimension is specified, CloudWatch returns statistics for all dimensions in the AWS/EC2 namespace. To get statistics for other metrics, see [Amazon CloudWatch Metrics and Dimensions Reference](#) (p. 97).

Important

This technique for retrieving all dimensions across an AWS namespace does not work for custom namespaces that you publish to Amazon CloudWatch. With custom namespaces, you must specify the complete set of dimensions that are associated with any given data point to retrieve statistics that include the data point.

To display average CPU utilization for your EC2 instances

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Metrics**.
3. Choose the **EC2** namespace and choose **Across All Instances**.
4. Select the row that contains **CPUUtilization**, which displays a graph for the metric for all your EC2 instances. To change the name of the graph, choose the pencil icon. To change the time range, select one of the predefined values or choose **custom**.

5. To change the statistic, choose the **Graphed metrics** tab. Choose the column heading or an individual value, and then choose one of the statistics or predefined percentiles, or specify a custom percentile (for example, p95.45).

6. To change the period, choose the **Graphed metrics** tab. Choose the column heading or an individual value, and then choose a different value.

To get average CPU utilization across your EC2 instances using the AWS CLI

Use the [get-metric-statistics](#) command as follows:

```
aws cloudwatch get-metric-statistics --namespace AWS/EC2 --metric-name CPUUtilization --
statistics "Average" "SampleCount" \
--start-time 2016-10-11T23:18:00 --end-time 2016-10-12T23:18:00 --period 3600
```

The following is example output:

```
{
  "Datapoints": [
    {
      "SampleCount": 238.0,
      "Timestamp": "2016-10-12T07:18:00Z",
      "Average": 0.038235294117647062,
      "Unit": "Percent"
    },
    {
      "SampleCount": 240.0,
      "Timestamp": "2016-10-12T09:18:00Z",
      "Average": 0.16670833333333332,
      "Unit": "Percent"
    },
    {
      "SampleCount": 238.0,
      "Timestamp": "2016-10-11T23:18:00Z",
      "Average": 0.041596638655462197,
      "Unit": "Percent"
    },
    ...
  ],
  "Label": "CPUUtilization"
}
```

Aggregate Statistics by Auto Scaling Group

You can aggregate statistics for the EC2 instances in an Auto Scaling group. Amazon CloudWatch cannot aggregate data across regions. Metrics are completely separate between regions.

This example shows you how to get the total bytes written to disk for one Auto Scaling group. The total is computed for one-minute periods for a 24-hour interval across all EC2 instances in the specified Auto Scaling group.

To display DiskWriteBytes for the instances in an Auto Scaling group using the console

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Metrics**.
3. Choose the **EC2** namespace and then choose **By Auto Scaling Group**.
4. Select the row for the **DiskWriteBytes** metric and the specific Auto Scaling group, which displays a graph for the metric for the instances in the Auto Scaling group. To change the name of the graph, choose the pencil icon. To change the time range, select one of the predefined values or choose **custom**.

5. To change the statistic, choose the **Graphed metrics** tab. Choose the column heading or an individual value, and then choose one of the statistics or predefined percentiles, or specify a custom percentile (for example, p95.45).
6. To change the period, choose the **Graphed metrics** tab. Choose the column heading or an individual value, and then choose a different value.

To get DiskWriteBytes for the instances in an Auto Scaling group using the AWS CLI

Use the `get-metric-statistics` command as follows:

```
aws cloudwatch get-metric-statistics --namespace AWS/EC2 --metric-name DiskWriteBytes
--dimensions Name=AutoScalingGroupName,Value=my-asg --statistics "Sum" "SampleCount" \
--start-time 2016-10-16T23:18:00 --end-time 2016-10-18T23:18:00 --period 360
```

The following is example output:

```
{
  "Datapoints": [
    {
      "SampleCount": 18.0,
      "Timestamp": "2016-10-19T21:36:00Z",
      "Sum": 0.0,
      "Unit": "Bytes"
    },
    {
      "SampleCount": 5.0,
      "Timestamp": "2016-10-19T21:42:00Z",
      "Sum": 0.0,
      "Unit": "Bytes"
    }
  ],
  "Label": "DiskWriteBytes"
}
```

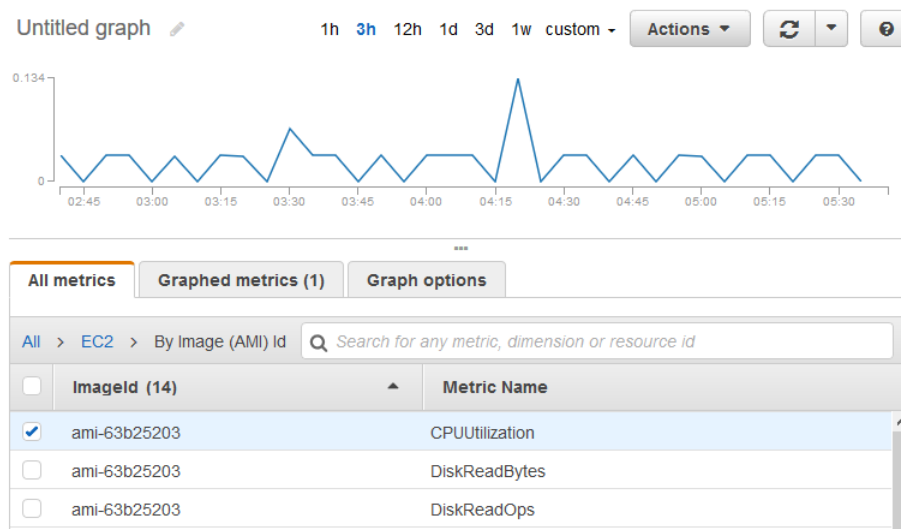

Aggregate Statistics by Amazon Machine Image (AMI)

You can aggregate statistics for the EC2 instances that have detailed monitoring enabled. Instances that use basic monitoring are not included. For more information, see [Enable or Disable Detailed Monitoring for Your Instances](#) in the *Amazon EC2 User Guide for Linux Instances*.

This example shows you how to determine average CPU utilization for all instances that use the specified AMI. The average is over 60-second time intervals for a one-day period.

To display the average CPU utilization by AMI using the console

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Metrics**.
3. Choose the **EC2** namespace and then choose **By Image (AMI) Id**.
4. Select the row for the **CPUtilization** metric and the specific AMI, which displays a graph for the metric for the specified AMI. To change the name of the graph, choose the pencil icon. To change the time range, select one of the predefined values or choose **custom**.

5. To change the statistic, choose the **Graphed metrics** tab. Choose the column heading or an individual value, and then choose one of the statistics or predefined percentiles, or specify a custom percentile (for example, p95.45).
6. To change the period, choose the **Graphed metrics** tab. Choose the column heading or an individual value, and then choose a different value.

To get the average CPU utilization by AMI using the AWS CLI

Use the [get-metric-statistics](#) command as follows:

```
aws cloudwatch get-metric-statistics --namespace AWS/EC2 --metric-name CPUtilization \
--dimensions Name=ImageId,Value=ami-3c47a355 --statistics Average \
--start-time 2016-10-10T00:00:00 --end-time 2016-10-11T00:00:00 --period 3600
```

The operation returns statistics that are one-minute values for the one-day interval. Each value represents an average CPU utilization percentage for EC2 instances running the specified AMI. The following is example output:

```
{
```

```
"Datapoints": [
  {
    "Timestamp": "2016-10-10T07:00:00Z",
    "Average": 0.041000000000000009,
    "Unit": "Percent"
  },
  {
    "Timestamp": "2016-10-10T14:00:00Z",
    "Average": 0.079579831932773085,
    "Unit": "Percent"
  },
  {
    "Timestamp": "2016-10-10T06:00:00Z",
    "Average": 0.0360000000000000011,
    "Unit": "Percent"
  },
  ...
],
"Label": "CPUUtilization"
}
```

Graph Metrics

You can use the CloudWatch console to graph metric data generated by other AWS services to make it easier to see the metric activity on your services. You can use the following procedures to graph metrics in CloudWatch.

Contents

- [Graph a Metric \(p. 37\)](#)
- [Modify the Time Range or Time Zone Format for a Graph \(p. 39\)](#)
- [Modify the Y Axis for a Graph \(p. 40\)](#)
- [Create an Alarm from a Metric on a Graph \(p. 41\)](#)

Graph a Metric

You can select metrics and create graphs of the data using the CloudWatch console.

CloudWatch supports the following statistics on metrics: Average, Minimum, Maximum, Sum, and SampleCount. For more information, see [Statistics \(p. 5\)](#).

You can view your data at different granularities. For example, you can choose a detailed view (for example 1 minute), which can be useful when troubleshooting. You can choose a less detailed view (for example, 1 hour), which can be useful when viewing a broader time range (for example, 3 days) so that you can see trends over time. For more information, see [Periods \(p. 6\)](#).

Create a Graph

To graph a metric

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Metrics**.
3. On the **All metrics** tab, type a search term in the search field, such as a metric name or resource name, and press Enter.

For example, if you search for the **CPUUtilization** metric, you see the namespaces and dimensions with this metric.

4. Select one of the results for your search to view the metrics.
5. To graph one or more metrics, select the check box next to each metric. To select all metrics, select the check box in the heading row of the table.
6. To view more information about the metric being graphed, hover over the legend.
7. Horizontal annotations can help graph users quickly see when a metric has spiked to a certain level, or whether the metric is within a predefined range. To add a horizontal annotation, choose **Graph options, Add horizontal annotation**:
 - a. For **Label**, type a label for the annotation.
 - b. For **Value**, type the metric value where the horizontal annotation appears.
 - c. For **Fill**, specify whether to use fill shading with this annotation. For example, choose **Above** or **Below** for the corresponding area to be filled. If you specify **Between**, another **Value** field appears, and the area of the graph between the two values is filled.
 - d. For **Axis**, specify whether the numbers in **Value** refer to the metric associated with the left Y-axis or the right Y-axis, if the graph includes multiple metrics.

You can change the fill color of an annotation by choosing the color square in the left column of the annotation.

Repeat these steps to add multiple horizontal annotations to the same graph.

To hide an annotation, clear the checkbox in the left column for that annotation.

To delete an annotation, choose **x** in the **Actions** column.

8. To get a URL for your graph, choose **Actions, Share**. Copy the URL and save it or share it.
9. To add your graph to a dashboard, choose **Actions, Add to dashboard**.

Update a Graph

To update your graph

1. To change the name of the graph, choose the pencil icon.
2. To change the time range, select one of the predefined values or choose **custom**. For more information, see [Modify the Time Range or Time Zone Format for a Graph \(p. 39\)](#).
3. To change the statistic, choose the **Graphed metrics** tab. Choose the column heading or an individual value, and then choose one of the statistics or predefined percentiles, or specify a custom percentile (for example, p95.45).
4. To change the period, choose the **Graphed metrics** tab. Choose the column heading or an individual value, and then choose a different value.
5. To add a horizontal annotation, choose **Graph options, Add horizontal annotation**:
 - a. For **Label**, type a label for the annotation.
 - b. For **Value**, type the metric value where the horizontal annotation appears.
 - c. For **Fill**, specify whether to use fill shading with this annotation. For example, choose **Above** or **Below** for the corresponding area to be filled. If you specify **Between**, another **Value** field appears, and the area of the graph between the two values is filled.
 - d. For **Axis**, specify whether the numbers in **Value** refer to the metric associated with the left Y-axis or the right Y-axis, if the graph includes multiple metrics.

You can change the fill color of an annotation by choosing the color square in the left column of the annotation.

Repeat these steps to add multiple horizontal annotations to the same graph.

To hide an annotation, clear the checkbox in the left column for that annotation.

To delete an annotation, choose **x** in the **Actions** column.

6. To change the refresh interval, choose **Refresh options**, and then select **Auto refresh** or choose **1 Minute**, **2 Minutes**, **5 Minutes**, or **15 Minutes**.

Duplicate a Metric

To duplicate a metric

1. Choose the **Graphed metrics** tab.
2. For **Actions**, choose the **Duplicate** icon.

3. Update the duplicate metric as needed.

Modify the Time Range or Time Zone Format for a Graph

You can change the time range or the time zone format of a graph..

Relative Time Ranges

You can set a relative time range for your graph.

To specify a relative time range for a graph

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Metrics**.
3. Select one of the predefined ranges shown at the top of the page, which span from 1 hour to 1 week ago.
4. For more predefined ranges, choose the **custom** menu and then choose **Relative**. Select one of the predefined ranges, which span from 5 minutes to 15 months ago.

Absolute Time Ranges

You can set an absolute time range for your graph.

To specify an absolute time range for a graph

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Metrics**.
3. Choose the **custom** menu and then choose **Absolute**. Use the calendar picker or the text fields to specify the time range.

Setting the Time Zone Format

You can specify whether the graph uses UTC time or your local time.

To specify the time zone for a graph

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Metrics**.
3. Choose **custom** menu and then choose **UTC** or **Local timezone**.

Zoom in on a Graph

You can change the granularity of a graph and zoom in to see data over a shorter time period.

To zoom in on a graph

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Metrics**.
3. Choose and drag on the graph area, and then release the drag.
4. To reset a zoomed-in graph, choose the **Reset zoom** icon.

Modify the Y Axis for a Graph

You can set custom bounds for the Y axis on a graph to help you see the data better. For example, you can change the bounds on a CPUUtilization graph to 100 percent so that it's easy to see whether the CPU is low (the plotted line is near the bottom of the graph) or high (the plotted line is near the top of the graph).

You can switch between two different Y axes for your graph. This is useful if the graph contains metrics that have different units or that differ greatly in their range of values.

To modify the Y axis on a graph

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Metrics**.
3. Select a metric namespace (for example, EC2) and then a metric dimension (for example, Per-Instance Metrics).
4. The **All metrics** tab displays all metrics for that dimension in that namespace. To graph a metric, select the check box next to the metric.
5. On the **Graph options** tab, specify the **Min** and **Max** values for **Left Y Axis**. The value of **Min** cannot be greater than the value of **Max**.

All metrics **Graphed metrics (1)** **Graph options**

Left Y Axis

Limits Min 0 Max 100

Right Y Axis

Limits Min Auto Max Auto

6. To create a second Y axis, specify the **Min** and **Max** values for **Right Y Axis**.
7. To switch between the two Y axes, choose the **Graphed metrics** tab. For **Y Axis**, choose **Left Y Axis** or **Right Y Axis**.

Graphed metrics (1) **Graph options**

	Namespace	Dimensions	Metric Name	Statistic	Period	Y Axis	Actions
lization	AWS/EC2	Dimensions (1)	CPUUtilization	Average	5 Minutes	Left Y Axis Right Y Axis	  

Create an Alarm from a Metric on a Graph

You can graph a metric and then create an alarm from the metric on the graph, which has the benefit of populating many of the alarm fields for you.

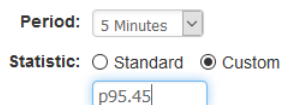

To create an alarm from a metric on a graph

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Metrics**.
3. Select a metric namespace (for example, EC2) and then a metric dimension (for example, Per-Instance Metrics).
4. The **All metrics** tab displays all metrics for that dimension in that namespace. To graph a metric, select the check box next to the metric.
5. To create an alarm for the metric, choose the **Graphed metrics** tab. For **Actions**, choose the alarm icon.

Graphed metrics (1) **Graph options**

	Namespace	Dimensions	Metric Name	Statistic	Period	Y Axis	Actions
lization	AWS/EC2	Dimensions (1)	CPUUtilization	Average	5 Minutes	Left Y Axis Right Y Axis	   Create alarm

6. Under **Alarm Threshold**, type a unique name for the alarm and a description of the alarm. For **Whenever**, specify a threshold and the number of periods.
7. Under **Actions**, select the type of action to have the alarm perform when the alarm is triggered.
8. (Optional) For **Period**, choose a different value. For **Statistic**, choose **Standard** to specify one of the statistics in the list or choose **Custom** to specify a percentile (for example, p95.45).

Period: 5 Minutes

Statistic: ☐ Standard ☒ Custom

p95.45

9. Choose **Create Alarm**.

Publish Custom Metrics

You can publish your own metrics to CloudWatch using the AWS CLI or an API. You can view statistical graphs of your published metrics with the AWS Management Console.

CloudWatch stores data about a metric as a series of data points. Each data point has an associated time stamp. You can even publish an aggregated set of data points called a *statistic set*.

Topics

- [High-Resolution Metrics \(p. 42\)](#)
- [Using Dimensions \(p. 42\)](#)
- [Publish Single Data Points \(p. 43\)](#)
- [Publish Statistic Sets \(p. 44\)](#)
- [Publish the Value Zero \(p. 44\)](#)

High-Resolution Metrics

Each metric is one of the following:

- Standard resolution, with data having a one-minute granularity
- High resolution, with data at a granularity of one second

Metrics produced by AWS services are standard resolution by default. When you publish a custom metric, you can define it as either standard resolution or high resolution. When you publish a high-resolution metric, CloudWatch stores it with a resolution of 1 second, and you can read and retrieve it with a period of 1 second, 5 seconds, 10 seconds, 30 seconds, or any multiple of 60 seconds.

High-resolution metrics can give you more immediate insight into your application's sub-minute activity. Keep in mind that every `PutMetricData` call for a custom metric is charged, so calling `PutMetricData` more often on a high-resolution metric can lead to higher charges. For more information about CloudWatch pricing, see [Amazon CloudWatch Pricing](#).

If you set an alarm on a high-resolution metric, you can specify a high-resolution alarm with a period of 10 seconds or 30 seconds, or you can set a regular alarm with a period of any multiple of 60 seconds. There is a higher charge for high-resolution alarms with a period of 10 or 30 seconds.

Using Dimensions

In custom metrics, the `--dimensions` parameter is common. A dimension further clarifies what the metric is, and what data it stores. You can have up to 10 dimensions in one metric, and each dimension is defined by a Name and Value pair.

Note that how you specify a dimension is different when you use different commands. With `put-metric-data`, you specify each dimension as `MyName=MyValue`, while with `get-metric-statistics` or `put-metric-`

[alarm](#) you use the format `Name=MyName, Value=MyValue`. For example, the following command publishes a "Buffers" metric with two dimensions named `InstanceId` and `InstanceType`.

```
aws cloudwatch put-metric-data --metric-name Buffers --namespace MyNameSpace --unit Bytes
--value 231434333 --dimensions InstanceId=1-23456789,InstanceType=m1.small
```

This command retrieves statistics for that same metric. Separate the Name and Value parts of a single dimension with commas, but you use a space between one dimension and the next if you have multiple dimensions.

```
aws cloudwatch get-metric-statistics --metric-name Buffers --namespace MyNameSpace --
dimensions Name=InstanceId,Value=1-23456789 Name=InstanceType,Value=m1.small --start-time
2016-10-15T04:00:00Z --end-time 2016-10-19T07:00:00Z --statistics Average --period 60
```

If a single metric includes multiple dimensions, you must specify a value for every defined dimension when you use [get-metric-statistics](#). For example, the Amazon S3 metric `BucketSizeBytes` includes the dimensions `BucketName` and `StorageType`, so you must specify both dimensions with [get-metric-statistics](#).

```
aws cloudwatch get-metric-statistics --metric-name BucketSizeBytes --start-time
2017-01-23T14:23:00Z --end-time 2017-01-26T19:30:00Z --period 3600 --namespace
AWS/S3 --statistics Maximum --dimensions Name=BucketName,Value=MyBucketName
Name=StorageType,Value=StandardStorage --output table
```

You can see what dimensions are defined for a metric by using the [list-metrics](#) command.

Publish Single Data Points

To publish a single data point for a new or existing metric, use the [put-metric-data](#) command with one value and time stamp. For example, the following actions each publish one data point:

```
aws cloudwatch put-metric-data --metric-name PageViewCount --namespace MyService --value 2
--timestamp 2016-10-20T12:00:00.000Z
aws cloudwatch put-metric-data --metric-name PageViewCount --namespace MyService --value 4
--timestamp 2016-10-20T12:00:01.000Z
aws cloudwatch put-metric-data --metric-name PageViewCount --namespace MyService --value 5
--timestamp 2016-10-20T12:00:02.000Z
```

If you call this command with a new metric name, CloudWatch creates a metric for you. Otherwise, CloudWatch associates your data with the existing metric that you specified.

Note

When you create a metric, it can take up to two minutes before you can retrieve statistics for the new metric using the [get-metric-statistics](#) command. However, it can take up to fifteen minutes before the new metric appears in the list of metrics retrieved using the [list-metrics](#) command.

Although you can publish data points with time stamps as granular as one-thousandth of a second, CloudWatch aggregates the data to a minimum granularity of one minute. CloudWatch records the average (sum of all items divided by number of items) of the values received for every 1-minute period, as well as the number of samples, maximum value, and minimum value for the same time period. For example, the `PageViewCount` metric from the previous examples contains three data points with time stamps just seconds apart. CloudWatch aggregates the three data points because they all have time stamps within a one-minute period.

CloudWatch uses one-minute boundaries when aggregating data points. For example, CloudWatch aggregates the data points from the previous example because all three data points fall

within the one-minute period that begins at 2016-10-20T12:00:00.000Z and ends at 2016-10-20T12:01:00.000Z.

You can use the **get-metric-statistics** command to retrieve statistics based on the data points that you published.

```
aws cloudwatch get-metric-statistics --namespace MyService --metric-name PageViewCount \
--statistics "Sum" "Maximum" "Minimum" "Average" "SampleCount" \
--start-time 2016-10-20T12:00:00.000Z --end-time 2016-10-20T12:05:00.000Z --period 60
```

The following is example output:

```
{
  "Datapoints": [
    {
      "SampleCount": 3.0,
      "Timestamp": "2016-10-20T12:00:00Z",
      "Average": 3.6666666666666665,
      "Maximum": 5.0,
      "Minimum": 2.0,
      "Sum": 11.0,
      "Unit": "None"
    }
  ],
  "Label": "PageViewCount"
}
```

Publish Statistic Sets

You can aggregate your data before you publish to CloudWatch. When you have multiple data points per minute, aggregating data minimizes the number of calls to **put-metric-data**. For example, instead of calling **put-metric-data** multiple times for three data points that are within three seconds of each other, you can aggregate the data into a statistic set that you publish with one call, using the **--statistic-values** parameter:

```
aws cloudwatch put-metric-data --metric-name PageViewCount --namespace MyService
--statistic-values Sum=11,Minimum=2,Maximum=5,SampleCount=3 --
timestamp 2016-10-14T12:00:00.000Z
```

CloudWatch needs raw data points to calculate percentiles. If you publish data using a statistic set instead, you cannot retrieve percentile statistics for this data unless one of the following conditions is true:

- The SampleCount of the statistic set is 1.
- The Min and the Max of the statistic set are equal.

Publish the Value Zero

When your data is more sporadic and you have periods that have no associated data, you can choose to publish the value zero (0) for that period or no value at all. If you use periodic calls to `PutMetricData` to monitor the health of your application, you might want to publish zero instead of no value. For example, you can set a CloudWatch alarm to notify you if your application fails to publish metrics every five minutes. You want such an application to publish zeros for periods with no associated data.

You might also publish zeros if you want to track the total number of data points or if you want statistics such as minimum and average to include data points with the value 0.

Collect Metrics and Logs from Amazon EC2 Instances and On-Premises Servers with the CloudWatch Agent

The unified CloudWatch agent enables you to do the following:

- Collect more system-level metrics from Amazon EC2 instances, including in-guest metrics, in addition to the metrics listed in [Amazon EC2 Metrics and Dimensions \(p. 133\)](#). The additional metrics are listed in [Metrics Collected by the CloudWatch Agent \(p. 108\)](#).
- Collect system-level metrics from on-premises servers. These can include servers in a hybrid environment as well as servers not managed by AWS.
- Collect logs from Amazon EC2 instances and on-premises servers, running either Linux or Windows Server.

You can store and view the metrics you collect with the CloudWatch agent in CloudWatch just as you can with any other CloudWatch metrics. The default namespace for metrics collected by the CloudWatch agent is `CWAgent`, although you can specify a different namespace when you configure the agent.

The logs collected by the unified CloudWatch agent are processed and stored in CloudWatch Logs, just like logs collected by the older CloudWatch Logs agent. For information about CloudWatch Logs pricing, see [Amazon CloudWatch Pricing](#).

Metrics collected by the CloudWatch agent are billed as custom metrics. For more information about CloudWatch metrics pricing, see [Amazon CloudWatch Pricing](#).

The steps in this section explain how to install the unified CloudWatch agent on Amazon EC2 instances and on-premises servers. For more information about the metrics that can be collected by the CloudWatch agent, see [Metrics Collected by the CloudWatch Agent \(p. 108\)](#).

Supported Operating Systems

The CloudWatch agent is supported on the following operating systems:

- Amazon Linux version 2014.03.02 or later
- Ubuntu Server version 16.04 and 14.04
- CentOS version 7.0 and 6.5
- Red Hat Enterprise Linux (RHEL) version 7.4, 7.0, and 6.5
- Debian 8.0
- 64-bit versions of Windows Server 2016, Windows Server 2012, and Windows Server 2008.

Installation Process Overview

The general flow of installing the CloudWatch agent is as follows:

1. Create the IAM roles and users that you need for the CloudWatch agent. They enable CloudWatch to collect metrics from the server, and to integrate with AWS Systems Manager.
2. If you are installing on an Amazon EC2 instance, attach an IAM role to the instance. If you are installing on an on-premises server, create an IAM user to enable the CloudWatch agent to write information to CloudWatch.
3. Download the agent package, using either AWS Systems Manager Run Command or a public Amazon S3 download link.
4. Modify the CloudWatch agent configuration files, and create a named profile for CloudWatch agent. Creating the named profile is optional when installing the agent on an Amazon EC2 instance.
5. Start the agent, using either Systems Manager Run Command or the command line.

Create IAM Roles and Users for Use With CloudWatch Agent

Access to AWS resources requires permissions. You can create IAM roles and users that include the permissions you need for the CloudWatch agent to write metrics to CloudWatch, and for the CloudWatch agent to communicate with Amazon EC2 and AWS Systems Manager. You use IAM roles on Amazon EC2 instances, and you use IAM users with on-premises servers to enable the agent to send data to CloudWatch.

One role and one user enable CloudWatch agent to be installed on a server and send metrics to CloudWatch. The other role or user is needed to store your CloudWatch agent configuration in Systems Manager Parameter Store, which enables multiple servers to use one CloudWatch agent configuration.

The ability to write to Parameter Store is a broad and powerful permission, and should be used only when you need it, and should not be attached to multiple instances in your deployment. If you are going to store your CloudWatch agent configuration in Parameter Store, you should set up one instance where you perform this configuration, and use the IAM role with permissions to write to Parameter Store only on this instance, and only while you are working with and saving the CloudWatch agent configuration file.

Note

We recently modified the following procedures by using new **CloudWatchAgentServerPolicy** and **CloudWatchAgentAdminPolicy** policies created by Amazon, instead of requiring customers to create these policies themselves. For writing files to and downloading files from the Parameter Store, the policies created by Amazon support only files with names that start with "AmazonCloudWatch-" If you have a CloudWatch agent configuration file with a filename that does not start with `AmazonCloudWatch-`, these policies cannot be used to write the file to Parameter Store or download it from Parameter Store.

Create IAM Roles to Use with CloudWatch Agent on Amazon EC2 Instances

The first procedure creates the IAM role that you need to attach to each Amazon EC2 instance that runs the CloudWatch agent. This role provides permissions for reading information from the instance and writing it to CloudWatch.

The second procedure creates the IAM role that you need to attach to the Amazon EC2 instance being used to create the CloudWatch agent configuration file, if you are going to store this file in Systems Manager Parameter Store so that other servers can use it. This role provides permissions for writing to Parameter Store, in addition to the permissions for reading information from the instance and writing it to CloudWatch. This role includes permissions sufficient to run the CloudWatch agent as well as to write to Parameter Store.

To create the IAM role necessary for each server to run CloudWatch agent

1. Sign in to the AWS Management Console and open the IAM console at <https://console.aws.amazon.com/iam/>.
2. In the navigation pane on the left, choose **Roles**, **Create role**.
3. For **Choose the service that will use this role**, choose **EC2 Allows EC2 instances to call AWS services on your behalf**. Choose **Next: Permissions**.
4. In the list of policies, select the check box next to **CloudWatchAgentServerPolicy**. Use the search box to find the policy, if necessary.
5. If you will use SSM to install or configure the CloudWatch agent, select the check box next to **AmazonEC2RoleforSSM**. Use the search box to find the policy, if necessary. This policy is not necessary if you will start and configure the agent only through the command line.
6. Choose **Next: Review**.
7. Confirm that **CloudWatchAgentServerPolicy** and optionally **AmazonEC2RoleforSSM** appear next to **Policies**. In **Role name**, type a name for the role, such as `CloudWatchAgentServerRole`. Optionally give it a description, and choose **Create role**.

The role is now created.

The following procedure creates the IAM role that can also write to Parameter Store. You need to use this role if you are going to store the agent configuration file in Parameter Store so that other servers can use it. This role provides permissions for writing to Parameter Store, in addition to the permissions for reading information from the instance and writing it to CloudWatch. The permissions for writing to Parameter Store provide broad powers, and should not be attached to all your servers, and should be used only by administrators. After you are finished creating the agent configuration file and copying it to Parameter Store, you should detach this role from the instance and use the **CloudWatchAgentServerPolicy** instead.

To create the IAM role necessary for an administrator to save an agent configuration file to Systems Manager Parameter Store

1. Sign in to the AWS Management Console and open the IAM console at <https://console.aws.amazon.com/iam/>.
2. In the navigation pane on the left, choose **Roles**, **Create role**.
3. For **Choose the service that will use this role**, choose **EC2 Allows EC2 instances to call AWS services on your behalf**. Choose **Next: Permissions**.
4. In the list of policies, select the check box next to **CloudWatchAgentAdminPolicy**. Use the search box to find the policy, if necessary.

5. If you will use SSM to install or configure the CloudWatch agent, select the check box next to **AmazonEC2RoleforSSM**. Use the search box to find the policy, if necessary. This policy is not necessary if you will start and configure the agent only through the command line.
6. Choose **Next: Review**
7. Confirm that **CloudWatchAgentAdminPolicy** and optionally **AmazonEC2RoleforSSM** appear next to **Policies**. In **Role name**, type a name for the role, such as `CloudWatchAgentAdminRole`. Optionally give it a description, and choose **Create role**.

The role is now created.

Create IAM Users to Use with CloudWatch Agent on On-premises Servers

The first procedure creates the IAM user that you need for running the CloudWatch agent. This user provides permissions for sending data to CloudWatch.

The second procedure creates the IAM user that you can use when creating the CloudWatch agent configuration file, if you are going to store this file in Systems Manager Parameter Store so that other servers can use it. This user provides permissions for writing to Parameter Store, in addition to the permissions for writing data to CloudWatch.

To create the IAM user necessary for CloudWatch agent to write data to CloudWatch

1. Sign in to the AWS Management Console and open the IAM console at <https://console.aws.amazon.com/iam/>.
2. In the navigation pane on the left, choose **Users, Add user**.
3. Type the user name for the new user.
4. Select **Programmatic access**, and choose **Next: Permissions**.
5. Choose **Attach existing policies directly**.
6. In the list of policies, select the check box next to **CloudWatchAgentServerPolicy**. Use the search box to find the policy, if necessary.
7. If you will use SSM to install or configure the CloudWatch agent, select the check box next to **AmazonEC2RoleforSSM**. Use the search box to find the policy, if necessary. This policy is not necessary if you will start and configure the agent only through the command line.
8. Choose **Next: Review**.
9. Confirm that the correct policies are listed, and choose **Create user**.
10. Next to the name of the new user, choose **Show**. Copy the access key and secret key to a file so that you can use them when installing the agent, and choose **Close**.

The following procedure creates the IAM user that can also write to Parameter Store. If you are going to store the agent configuration file in Parameter Store so that other servers can use it, you need to use this user. This user provides permissions for writing to Parameter Store, in addition to the permissions for reading information from the instance and writing it to CloudWatch. The permissions for writing to Systems Manager Parameter Store provide broad powers, and should not be attached to all your servers, and should be used only by administrators. You should use this IAM user only when you are storing the agent configuration file in Parameter Store.

To create the IAM user necessary to store the configuration file in Parameter Store and send information to CloudWatch

1. Sign in to the AWS Management Console and open the IAM console at <https://console.aws.amazon.com/iam/>.

2. In the navigation pane on the left, choose **Users, Add user**.
3. Type the user name for the new user.
4. Select **Programmatic access**, and choose **Next: Permissions**.
5. Choose **Attach existing policies directly**.
6. In the list of policies, select the check box next to **CloudWatchAgentAdminPolicy**. Use the search box to find the policy, if necessary.
7. If you will use SSM to install or configure the CloudWatch agent, select the check box next to **AmazonEC2RoleforSSM**. Use the search box to find the policy, if necessary. This policy is not necessary if you will start and configure the agent only through the command line.
8. Choose **Next: Review**.
9. Confirm that the correct policies are listed, and choose **Create user**.
10. Next to the name of the new user, choose **Show**. Copy the access key and secret key to a file so that you can use them when installing the agent, and choose **Close**.

Install the CloudWatch Agent on an Amazon EC2 Instance

When you first start using CloudWatch agent, you download it to a server and configure the agent. You can then use the agent with that configuration directly on that server, and if you save the configuration in AWS Systems Manager Parameter Store, you can also use the same configuration when you install the CloudWatch agent on other servers.

Topics

- [Getting Started: Installing the CloudWatch Agent on Your First Instance \(p. 49\)](#)
- [Installing CloudWatch Agent on Additional Instances Using Your Agent Configuration \(p. 54\)](#)

Getting Started: Installing the CloudWatch Agent on Your First Instance

To download and install the CloudWatch agent on a running Amazon EC2 instance, you can use either AWS Systems Manager or the command line. With either method, you must first create an IAM role and attach it to the instance.

Topics

- [Attach an IAM Role to the Instance \(p. 49\)](#)
- [Download the CloudWatch Agent Package on an Amazon EC2 Instance \(p. 50\)](#)
- [\(Optional\) Modify the Common Configuration and Named Profile for CloudWatch Agent \(p. 52\)](#)
- [Create the Agent Configuration File on Your First Instance \(p. 53\)](#)
- [Start the CloudWatch Agent \(p. 53\)](#)

Attach an IAM Role to the Instance

An IAM role for the instance profile is required when you install the CloudWatch agent on an Amazon EC2 instance. This role enables the CloudWatch agent to perform actions on the instance. Use one of the roles you created earlier. For more information about creating these roles, see [Create IAM Roles and Users for Use With CloudWatch Agent \(p. 46\)](#). You can scroll through the list to find them, or use the search box.

If you are going to use this instance to create the CloudWatch agent configuration file and copy it to Systems Manager Parameter Store, use the role you created that has permissions to write to Parameter Store. This role may be called **CloudWatchAgentAdminPolicy**.

For all other instances, select the role that includes just the permissions needed to install and run the agent. This role may be called **CloudWatchAgentServerPolicy**.

Attach this role to the instance on which you install the CloudWatch agent. For more information, see [Attaching an IAM Role to an Instance](#) in the *Amazon EC2 User Guide for Windows Instances*.

Download the CloudWatch Agent Package on an Amazon EC2 Instance

You can download the CloudWatch agent package using either Systems Manager Run Command or an Amazon S3 download link.

Download the CloudWatch Agent on an Amazon EC2 Instance Using AWS Systems Manager

Before you can use Systems Manager to install the CloudWatch agent, you must make sure that the instance is configured correctly for Systems Manager.

Install or Update the SSM Agent

On an Amazon EC2 instance, the CloudWatch agent requires that the instance is running version 2.2.93.0 or later. Before you install the CloudWatch agent, update or install the SSM Agent on the instance if you haven't already done so.

For information about installing or updating the SSM Agent on an instance running Linux, see [Installing and Configuring the SSM Agent on Linux Instances](#) in the *AWS Systems Manager User Guide*.

For information about installing or updating the SSM Agent, see [Installing and Configuring the SSM Agent](#) in the *AWS Systems Manager User Guide*.

(Optional) Verify Systems Manager Prerequisites

Before you use Systems Manager Run Command to install and configure the CloudWatch agent, verify that your instances meet the minimum Systems Manager requirements. For more information, see [Systems Manager Prerequisites](#) in the *AWS Systems Manager User Guide*.

Verify Internet Access

Your Amazon EC2 instances must have outbound internet access in order to send data to CloudWatch or CloudWatch Logs. For more information about how to configure internet access, see [Internet Gateways](#) in the *Amazon VPC User Guide*.

The endpoints and ports to configure on your proxy are as follows:

- If you are using the agent to collect metrics, you must whitelist the CloudWatch endpoints for the appropriate regions. These endpoints are listed in [Amazon CloudWatch](#) in the *Amazon Web Services General Reference*.
- If you are using the agent to collect logs, you must whitelist the CloudWatch Logs endpoints for the appropriate regions. These endpoints are listed in [Amazon CloudWatch Logs](#) in the *Amazon Web Services General Reference*.
- If you are using SSM to install the agent or Parameter Store to store your configuration file, you must whitelist the SSM endpoints for the appropriate regions. These endpoints are listed in [AWS Systems Manager](#) in the *Amazon Web Services General Reference*.

Download the CloudWatch Agent Package Using Run Command

Systems Manager Run Command enables you to manage the configuration of your instances. You specify a Systems Manager document, specify parameters, and execute the command on one or more instances. The SSM Agent on the instance processes the command and configures the instance as specified.

To download the CloudWatch agent using Run Command

1. Open the Systems Manager console at <https://console.aws.amazon.com/systems-manager/>.
2. In the navigation pane, choose **Run Command**.

-or-

If the AWS Systems Manager home page opens, scroll down and choose **Explore Run Command**.

3. Choose **Run command**.
4. In the **Command document** list, choose **AWS-ConfigureAWSPackage**.
5. In the **Targets** area, choose the instance on which to install the CloudWatch agent. If you do not see a specific instance, it might not be configured for Run Command. For more information, see [Systems Manager Prerequisites](#) in the *Amazon EC2 User Guide for Windows Instances*.
6. In the **Action** list, choose **Install**.
7. In the **Name** field, type **AmazonCloudWatchAgent**.
8. Leave **Version** set to **latest** to install the latest version of the agent.
9. Choose **Run**.
10. Optionally, in the **Targets and outputs** areas, select the button next to an instance name and choose **View output**. Systems Manager should show that the agent was successfully installed.

Download the CloudWatch Agent Package on an Amazon EC2 Instance Using a Download Link

You can use an Amazon S3 download link to download the CloudWatch agent package on an Amazon EC2 instance server.

To use the command line to install the CloudWatch agent on an Amazon EC2 instance

1. Make a directory for downloading and unzipping the agent package. For example, `tmp/AmazonCloudWatchAgent`. Then change into that directory.
2. Download the CloudWatch agent. For a Linux server, type the following:

```
wget https://s3.amazonaws.com/amazoncloudwatch-agent/linux/amd64/latest/AmazonCloudWatchAgent.zip
```

For a server running Windows Server, download the following file:

```
https://s3.amazonaws.com/amazoncloudwatch-agent/windows/amd64/latest/AmazonCloudWatchAgent.zip
```

3. After you have downloaded the package, you can optionally use a GPG signature file to verify the package signature. For more information, see [Verify the Signature of the CloudWatch Agent Package](#) (p. 63).
4. Unzip the package.

```
unzip AmazonCloudWatchAgent.zip
```

5. Install the package. On a Linux server, change to the directory containing the package and type:

```
sudo ./install.sh
```

On a server running Windows Server, open PowerShell, change to the directory containing the unzipped package, and use the `install.ps1` script to install it.

(Optional) Modify the Common Configuration and Named Profile for CloudWatch Agent

The CloudWatch agent package you have downloaded includes a configuration file called `common-config.toml`. You can use this file to specify proxy, credential, and region information. On a server running Linux, this file is in the `/opt/aws/amazon-cloudwatch-agent/etc` directory. On a server running Windows Server, this file is in the `C:\ProgramData\Amazon\AmazonCloudWatchAgent` directory.

The default `common-config.toml` is as follows:

When you install the CloudWatch agent on an Amazon EC2 instance, you need to modify this file only if you need to specify proxy settings or if the agent should send metrics to CloudWatch in a different region than where the instance is located.

```
# This common-config is used to configure items used for both ssm and cloudwatch access

## Configuration for shared credential.
## Default credential strategy will be used if it is absent here:
##           Instance role is used for EC2 case by default.
##           AmazonCloudWatchAgent profile is used for onPremise case by default.
# [credentials]
#   shared_credential_profile = "{profile_name}"

## Configuration for proxy.
## System-wide environment-variable will be read if it is absent here.
## i.e. HTTP_PROXY/http_proxy; HTTPS_PROXY/https_proxy; NO_PROXY/no_proxy
## Note: system-wide environment-variable is not accessible when using ssm run-command.
## Absent in both here and environment-variable means no proxy will be used.
# [proxy]
#   http_proxy = "{http_url}"
#   https_proxy = "{https_url}"
#   no_proxy = "{domain}"
```

All lines are commented out initially. To set the credential profile or proxy settings, remove the `#` from that line and specify a value. You can edit this file manually, or by using the `RunShellScript` Run Command in Systems Manager:

- **shared_credential_profile** To have the CloudWatch agent send metrics to CloudWatch in the same region where the instance is located, you don't need to modify this line if you have attached an IAM role with the proper permissions to the instance, and you don't need to use the `aws configure` command to create a named profile for the agent.

Otherwise, you can use this line to specify the named profile that CloudWatch agent is to use in the AWS credentials and AWS config files. If you do so, CloudWatch agent uses the credential and the region settings in that named profile.

- **proxy settings** If your servers use HTTP or HTTPS proxies to contact AWS services, specify those proxies in the `http_proxy` and `https_proxy` fields. If there are URLs that should be excluded from proxying, specify them in the `no_proxy` field, separated by commas.

After modifying `common-config.toml`, if you need to specify credential and region information for CloudWatch agent, create a named profile for the CloudWatch agent in the AWS credentials and AWS config files. When you create this profile, do so as the root or administrator. Following is an example of this profile in the credentials file:

```
[AmazonCloudWatchAgent]
aws_access_key_id=my_access_key
aws_secret_access_key=my_secret_key
```

For `my_access_key` and `my_secret_key`, use the keys from the IAM user that does not have the permissions to write to Systems Manager Parameter Store. For more information about the IAM users needed for CloudWatch agent, see [Create IAM Users to Use with CloudWatch Agent on On-premises Servers](#) (p. 48).

Following is an example of the profile for the configuration file:

```
[AmazonCloudWatchAgent]
region=us-west-1
```

Following is an example of using the `aws configure` command to create a named profile for the CloudWatch agent. This example assumes that you are using the default profile name of `AmazonCloudWatchAgent`.

To create the `AmazonCloudWatchAgent` profile for the CloudWatch agent

- Type the following command and follow the prompts:

```
aws configure --profile AmazonCloudWatchAgent
```

Create the Agent Configuration File on Your First Instance

After you have downloaded the CloudWatch agent, you must create the configuration file before you start the agent on any servers. For more information, see [Create the CloudWatch Agent Configuration File](#) (p. 69).

Start the CloudWatch Agent

To start the agent on the same server where you created the agent configuration file, follow these steps. To use this configuration file on other servers, see [Installing CloudWatch Agent on Additional Instances Using Your Agent Configuration](#) (p. 54).

Start the CloudWatch Agent Using Run Command

Follow these steps to start the agent using Systems Manager Run Command.

To start the CloudWatch agent using Run Command

1. Open the Systems Manager console at <https://console.aws.amazon.com/systems-manager/>.
2. In the navigation pane, choose **Run Command**.

-or-

If the AWS Systems Manager home page opens, scroll down and choose **Explore Run Command**.

3. Choose **Run command**.
4. In the **Command document** list, choose **AmazonCloudWatch-ManageAgent**.

5. In the **Targets** area, choose the instance where you installed the CloudWatch agent.
6. In the **Action** list, choose **configure**.
7. In the **Optional Configuration Source** list, choose **ssm**.
8. In the **Optional Configuration Location** box, type the name of the agent configuration file that you created and saved to Systems Manager Parameter Store, as explained in [Create the CloudWatch Agent Configuration File \(p. 69\)](#).
9. In the **Optional Restart** list, choose **yes** to start the agent after you have finished these steps.
10. Choose **Run**.
11. Optionally, in the **Targets and outputs** areas, select the button next to an instance name and choose **View output**. Systems Manager should show that the agent was successfully started.

Start the CloudWatch Agent on an Amazon EC2 Instance Using the Command Line

Follow these steps to use the command line to install the CloudWatch agent on an Amazon EC2 instance.

To use the command line to start the CloudWatch agent on an Amazon EC2 instance

- On a Linux server, type the following if you saved the configuration file in the Systems Manager Parameter Store:

```
sudo /opt/aws/amazon-cloudwatch-agent/bin/amazon-cloudwatch-agent-ctl -a fetch-config -m ec2 -c ssm:configuration-parameter-store-name -s
```

On a Linux server, type the following if you saved the configuration file on the local computer:

```
sudo /opt/aws/amazon-cloudwatch-agent/bin/amazon-cloudwatch-agent-ctl -a fetch-config -m ec2 -c file:configuration-file-path -s
```

On a server running Windows Server, type the following if you saved the configuration file in Systems Manager Parameter Store:

```
amazon-cloudwatch-agent-ctl.ps1 -a fetch-config -m ec2 -c ssm:configuration-parameter-store-name -s
```

On a server running Windows Server, type the following if you saved the configuration file on the local computer:

```
amazon-cloudwatch-agent-ctl.ps1 -a fetch-config -m ec2 -c file:configuration-file-path -s
```

Installing CloudWatch Agent on Additional Instances Using Your Agent Configuration

After you have a CloudWatch agent configuration saved in Parameter Store, you can use it when you install the agent on other servers.

Topics

- [Create an IAM Role for Systems Manager and the CloudWatch Agent \(p. 55\)](#)
- [Download the CloudWatch Agent Package on an Amazon EC2 Instance \(p. 55\)](#)

- [\(Optional\) Modify the Common Configuration and Named Profile for CloudWatch Agent \(p. 57\)](#)
- [Start the CloudWatch Agent \(p. 58\)](#)

Create an IAM Role for Systems Manager and the CloudWatch Agent

An IAM role for the instance profile is required when you install the CloudWatch agent on an Amazon EC2 instance. This role enables the CloudWatch agent to perform actions on the instance. Use the role you created earlier that includes just the permissions needed for installing and running the agent. This role may be called **CloudWatchAgentServerPolicy**.

Attach this role to the instance where you install the CloudWatch agent. For more information, see [Attaching an IAM Role to an Instance](#) in the *Amazon EC2 User Guide for Windows Instances*.

Download the CloudWatch Agent Package on an Amazon EC2 Instance

You can download the CloudWatch agent package using either Systems Manager Run Command or an Amazon S3 download link.

Download the CloudWatch Agent on an Amazon EC2 Instance Using Systems Manager

Before you can use Systems Manager to install the CloudWatch agent, you must make sure that the instance is configured correctly for Systems Manager.

Install or Update the SSM Agent

On an Amazon EC2 instance, the CloudWatch agent requires that the instance is running version 2.2.93.0 or later. Before you install the CloudWatch agent, update or install the SSM Agent on the instance if you haven't already done so.

For information about installing or updating the SSM Agent on an instance running Linux, see [Installing and Configuring the SSM Agent on Linux Instances](#) in the *AWS Systems Manager User Guide*.

For information about installing or updating the SSM Agent, see [Installing and Configuring SSM Agent](#) in the *AWS Systems Manager User Guide*.

(Optional) Verify Systems Manager Prerequisites

Before you use Systems Manager Run Command to install and configure the CloudWatch agent, verify that your instances meet the minimum Systems Manager requirements. For more information, see [Systems Manager Prerequisites](#) in the *AWS Systems Manager User Guide*.

Verify Internet Access

Your Amazon EC2 instances must have outbound internet access in order to send data to CloudWatch or CloudWatch Logs. For more information about how to configure internet access, see [Internet Gateways](#) in the *Amazon VPC User Guide*.

Download the CloudWatch Agent Package Using Run Command

Systems Manager Run Command enables you to manage the configuration of your instances. You specify a Systems Manager document, specify parameters, and execute the command on one or more instances. The SSM Agent on the instance processes the command and configures the instance as specified.

To download the CloudWatch agent using Run Command

1. Open the Systems Manager console at <https://console.aws.amazon.com/systems-manager/>.
 2. In the navigation pane, choose **Run Command**.
- or-
- If the AWS Systems Manager home page opens, scroll down and choose **Explore Run Command**.
3. Choose **Run command**.
 4. In the **Command document** list, choose **AWS-ConfigureAWSPackage**.
 5. In the **Targets** area, choose the instance on which to install the CloudWatch agent. If you do not see a specific instance, it might not be configured for Run Command. For more information, see [Systems Manager Prerequisites](#) in the *Amazon EC2 User Guide for Windows Instances*.
 6. In the **Action** list, choose **Install**.
 7. In the **Name** box, type **AmazonCloudWatchAgent**.
 8. Leave **Version** set to **latest** to install the latest version of the agent.
 9. Choose **Run**.
 10. Optionally, in the **Targets and outputs** areas, select the button next to an instance name and choose **View output**. Systems Manager should show that the agent was successfully installed.

Download the CloudWatch Agent Package on an Amazon EC2 Instance Using a Download Link

You can use an Amazon S3 download link to download the CloudWatch agent package on an Amazon EC2 instance server.

To use the command line to install the CloudWatch agent on an Amazon EC2 instance

1. Make a directory for downloading and unzipping the agent package. For example, `tmp/AmazonCloudWatchAgent`. Then change into that directory.
2. Download the CloudWatch agent. For a Linux server, type the following:

```
wget https://s3.amazonaws.com/amazoncloudwatch-agent/linux/amd64/latest/AmazonCloudWatchAgent.zip
```

For a server running Windows Server, download the following file:

```
https://s3.amazonaws.com/amazoncloudwatch-agent/windows/amd64/latest/AmazonCloudWatchAgent.zip
```

3. After you have downloaded the package, you can optionally use a GPG signature file to verify the package signature. For more information, see [Verify the Signature of the CloudWatch Agent Package \(p. 63\)](#).
4. Unzip the package.

```
unzip AmazonCloudWatchAgent.zip
```

5. Install the package. On a Linux server, change to the directory containing the package and type:

```
sudo ./install.sh
```

On a server running Windows Server, open PowerShell, change to the directory containing the unzipped package, and use the `install.ps1` script to install it.

(Optional) Modify the Common Configuration and Named Profile for CloudWatch Agent

The CloudWatch agent package you have downloaded includes a configuration file called `common-config.toml`. You can use this file to specify proxy, credential, and region information. On a server running Linux, this file is in the `/opt/aws/amazon-cloudwatch-agent/etc` directory. On a server running Windows Server, this file is in the `C:\ProgramData\Amazon\AmazonCloudWatchAgent` directory.

The default `common-config.toml` is as follows:

When you install the CloudWatch agent on an Amazon EC2 instance, you need to modify this file only if you need to specify proxy settings or if the agent should send metrics to CloudWatch in a different region than where the instance is located.

```
# This common-config is used to configure items used for both ssm and cloudwatch access

## Configuration for shared credential.
## Default credential strategy will be used if it is absent here:
##      Instance role is used for EC2 case by default.
##      AmazonCloudWatchAgent profile is used for onPremise case by default.
# [credentials]
#   shared_credential_profile = "{profile_name}"

## Configuration for proxy.
## System-wide environment-variable will be read if it is absent here.
## i.e. HTTP_PROXY/http_proxy; HTTPS_PROXY/https_proxy; NO_PROXY/no_proxy
## Note: system-wide environment-variable is not accessible when using ssm run-command.
## Absent in both here and environment-variable means no proxy will be used.
# [proxy]
#   http_proxy = "{http_url}"
#   https_proxy = "{https_url}"
#   no_proxy = "{domain}"
```

All lines are commented out initially. To set the credential profile or proxy settings, remove the `#` from that line and specify a value. You can edit this file manually, or by using the `RunShellScript` Run Command in Systems Manager:

- **shared_credential_profile** To have the CloudWatch agent send metrics to CloudWatch in the same region where the instance is located, you don't need to modify this line if you have attached an IAM role with the proper permissions to the instance. You also don't need to use the `aws configure` command to create a named profile for the agent.

Otherwise, you can use this line to specify the named profile that CloudWatch agent is to use in the AWS credentials and AWS config files. If you do so, CloudWatch agent uses the credential and the region settings in that named profile.

- **proxy settings** If your servers use HTTP or HTTPS proxies to contact AWS services, specify those proxies in the `http_proxy` and `https_proxy` fields. If there are URLs that should be excluded from proxying, specify them in the `no_proxy` field, separated by commas.

After modifying `common-config.toml`, if you need to specify credential and region information for CloudWatch agent, create a named profile for the CloudWatch agent in the AWS credentials and AWS config files. When you create this profile, do so as the root or administrator. Following is an example of this profile in the credentials file:

```
[AmazonCloudWatchAgent]
```

```
aws_access_key_id=my_access_key  
aws_secret_access_key=my_secret_key
```

For `my_access_key` and `my_secret_key`, use the keys from the IAM user that does not have the permissions to write to Systems Manager Parameter Store. For more information about the IAM users needed for CloudWatch agent, see [Create IAM Users to Use with CloudWatch Agent on On-premises Servers](#) (p. 48).

Following is an example of the profile for the configuration file:

```
[AmazonCloudWatchAgent]  
region=us-west-1
```

Following is an example of using the `aws configure` command to create a named profile for the CloudWatch agent. This example assumes that you are using the default profile name of `AmazonCloudWatchAgent`.

To create the `AmazonCloudWatchAgent` profile for the CloudWatch agent

- Type the following command and follow the prompts:

```
aws configure --profile AmazonCloudWatchAgent
```

Start the CloudWatch Agent

You can start the agent using Systems Manager Run Command or the command line.

Start the CloudWatch Agent Using Systems Manager Run Command

Follow these steps to start the agent using Systems Manager Run Command.

To start the CloudWatch agent using Run Command

- Open the Systems Manager console at <https://console.aws.amazon.com/systems-manager/>.
- In the navigation pane, choose **Run Command**.

-or-

If the AWS Systems Manager home page opens, scroll down and choose **Explore Run Command**.

- Choose **Run command**.
- In the **Command document** list, choose **AmazonCloudWatch-ManageAgent**.
- In the **Targets** area, choose the instance where you installed the CloudWatch agent.
- In the **Action** list, choose **configure**.
- In the **Optional Configuration Source** list, choose **ssm**.
- In the **Optional Configuration Location** box, type the name of the agent configuration file that you created and saved to Systems Manager Parameter Store, as explained in [Create the CloudWatch Agent Configuration File](#) (p. 69).
- In the **Optional Restart** list, choose **yes** to start the agent after you have finished these steps.
- Choose **Run**.
- Optionally, in the **Targets and outputs** areas, select the button next to an instance name and choose **View output**. Systems Manager should show that the agent was successfully started.

Start the CloudWatch Agent on an Amazon EC2 Instance Using the Command Line

Follow these steps to use the command line to install the CloudWatch agent on an Amazon EC2 instance.

To use the command line to start the CloudWatch agent on an Amazon EC2 instance

- On a Linux server, type the following if you saved the configuration file in the Systems Manager Parameter Store:

```
sudo /opt/aws/amazon-cloudwatch-agent/bin/amazon-cloudwatch-agent-ctl -a fetch-config -m ec2 -c ssm:configuration-parameter-store-name -s
```

On a Linux server, type the following if you saved the configuration file on the local computer:

```
sudo /opt/aws/amazon-cloudwatch-agent/bin/amazon-cloudwatch-agent-ctl -a fetch-config -m ec2 -c file:configuration-file-path -s
```

On a server running Windows Server, type the following if you saved the configuration file in Systems Manager Parameter Store:

```
amazon-cloudwatch-agent-ctl.ps1 -a fetch-config -m ec2 -c ssm:configuration-parameter-store-name -s
```

On a server running Windows Server, type the following if you saved the configuration file on the local computer:

```
amazon-cloudwatch-agent-ctl.ps1 -a fetch-config -m ec2 -c file:configuration-file-path -s
```

Install the CloudWatch Agent on an On-Premises Server

When you first start using CloudWatch agent, you download it to a server and configure the agent. You can then use the agent with that configuration directly on that server. If you save the configuration in AWS Systems Manager Parameter Store, you can also use the same configuration when you install the CloudWatch agent on other servers.

Topics

- [Getting Started: Installing the CloudWatch Agent on Your First Server \(p. 59\)](#)
- [Installing CloudWatch Agent on Additional Servers Using Your Agent Configuration \(p. 66\)](#)

Getting Started: Installing the CloudWatch Agent on Your First Server

To download and install the CloudWatch agent on an on-premises server, you can use either AWS Systems Manager or the command line.

With either method, you must first create an IAM user with permissions to write to CloudWatch.

Topics

- [Download the CloudWatch Agent on an On-Premises Server \(p. 60\)](#)
- [Modify the Common Configuration and Named Profile for CloudWatch Agent \(p. 61\)](#)
- [Create the CloudWatch Agent Configuration File \(p. 62\)](#)
- [Start the CloudWatch Agent \(p. 62\)](#)
- [Verify the Signature of the CloudWatch Agent Package \(p. 63\)](#)

Download the CloudWatch Agent on an On-Premises Server

To download the CloudWatch agent, you can use Systems Manager or the command line.

To use Systems Manager Run Command, you must register your on-premises server with Amazon EC2 Systems Manager. For more information, see [Setting Up Systems Manager in Hybrid Environments](#) in the *AWS Systems Manager User Guide*.

If you have already registered your server, update your SSM Agent to the latest version.

For information about updating the SSM Agent on a server running Linux, see [Install the SSM Agent on Servers and VMs in Your Linux Hybrid Environment](#) in the *AWS Systems Manager User Guide*.

For information about updating the SSM Agent on a server running Windows Server, see [Install the SSM Agent on Servers and VMs in Your Windows Hybrid Environment](#) in the *AWS Systems Manager User Guide*.

To use the SSM Agent to download the CloudWatch agent package on an on-premises server

1. Open the Systems Manager console at <https://console.aws.amazon.com/systems-manager/>.
2. In the navigation pane, choose **Run Command**.

-or-

If the AWS Systems Manager home page opens, scroll down and choose **Explore Run Command**.

3. Choose **Run command**.
4. In the **Command document** list, select the button next to **AWS-ConfigureAWSPackage**.
5. In the **Targets** area, select the server on which to install the CloudWatch agent. If you do not see a specific server, it might not be configured for Run Command. For more information, see [Systems Manager Prerequisites](#) in the *Amazon EC2 User Guide for Windows Instances*.
6. In the **Action** list, choose **Install**.
7. In the **Name** box, type **AmazonCloudWatchAgent**.
8. Leave **Version** blank to install the latest version of the agent.
9. Choose **Run**.

The agent package is downloaded, and the next steps are to configure and start it.

To use the command line to download the CloudWatch agent on an on-premises server

1. Make a directory for downloading and unzipping the agent package. For example, `tmp/AmazonCloudWatchAgent`. Then change into that directory.
2. Download the CloudWatch agent package. For a Linux server, type the following:

```
wget https://s3.amazonaws.com/amazoncloudwatch-agent/linux/amd64/latest/AmazonCloudWatchAgent.zip
```

For a server running Windows Server, download the following file:

```
https://s3.amazonaws.com/amazoncloudwatch-agent/windows/amd64/latest/  
AmazonCloudWatchAgent.zip
```

3. After you have downloaded the package, you can optionally use a GPG signature file to verify the package signature. For more information, see [Verify the Signature of the CloudWatch Agent Package \(p. 63\)](#).
4. Unzip the package.

```
unzip AmazonCloudWatchAgent.zip
```

5. Install the package. On a Linux server, change to the directory containing the package and type:

```
sudo ./install.sh
```

On a server running Windows Server, open PowerShell, change to the directory containing the unzipped package, and use the `install.ps1` script to install it.

Modify the Common Configuration and Named Profile for CloudWatch Agent

The CloudWatch agent package you have downloaded includes a configuration file called `common-config.toml`. You can use this file to specify proxy, credential, and region information. On a server running Linux, this file is in the `/opt/aws/amazon-cloudwatch-agent/etc` directory. On a server running Windows Server, this file is in the `C:\ProgramData\Amazon\AmazonCloudWatchAgent` directory.

The default `common-config.toml` is as follows:

```
# This common-config is used to configure items used for both ssm and cloudwatch access  
  
## Configuration for shared credential.  
## Default credential strategy will be used if it is absent here:  
##           Instance role is used for EC2 case by default.  
##           AmazonCloudWatchAgent profile is used for onPremise case by default.  
# [credentials]  
#   shared_credential_profile = "{profile_name}"  
  
## Configuration for proxy.  
## System-wide environment-variable will be read if it is absent here.  
## i.e. HTTP_PROXY/http_proxy; HTTPS_PROXY/https_proxy; NO_PROXY/no_proxy  
## Note: system-wide environment-variable is not accessible when using ssm run-command.  
## Absent in both here and environment-variable means no proxy will be used.  
# [proxy]  
#   http_proxy = "{http_url}"  
#   https_proxy = "{https_url}"  
#   no_proxy = "{domain}"
```

All lines are commented out initially. To set the credential profile or proxy settings, remove the `#` from that line and specify a value. You can edit this file manually, or by using the `RunShellScript` Run Command in Systems Manager:

- **shared_credential_profile** You can specify a name for the named profile that CloudWatch agent is to look for in the AWS credentials and AWS config files. If you don't specify a name here, the CloudWatch agent looks for the default profile name, `AmazonCloudWatchAgent`.

- **proxy settings** If your servers use HTTP or HTTPS proxies to contact AWS services, specify those proxies in the `http_proxy` and `https_proxy` fields. If there are URLs that should be excluded from proxying, specify them in the `no_proxy` field, separated by commas.

After modifying `common-config.toml`, you should make sure the profile name that you specified, or the default profile name of `AmazonCloudWatchAgent`, exists in the root user's AWS credentials and config files. This profile is used for credential and region information during CloudWatch agent setup. Following is an example of this profile in the credentials file:

```
[AmazonCloudWatchAgent]
aws_access_key_id=my_access_key
aws_secret_access_key=my_secret_key
```

For `my_access_key` and `my_secret_key`, use the keys from the IAM user that does not have the permissions to write to Systems Manager Parameter Store. For more information about the IAM users needed for CloudWatch agent, see [Create IAM Users to Use with CloudWatch Agent on On-premises Servers](#) (p. 48).

Following is an example of the profile for the configuration file:

```
[AmazonCloudWatchAgent]
region=us-west-1
```

The named profile in the credentials file contains the credentials to be used for CloudWatch agent. These credentials are used for permissions to write metric data to CloudWatch, and to download information from Systems Manager Parameter Store during CloudWatch agent installation. You can obtain the credentials to use for this section by creating an IAM user for the CloudWatch agent, as explained previously in this section.

The named profile in the configuration file specifies the region to which the CloudWatch metrics are published, when the CloudWatch agent runs on an on-premises server. When you use the `aws configure` command to modify the profile, do so as the root or administrator.

Following is an example of using the `aws configure` command to create a named profile for the CloudWatch agent. This example assumes that you are using the default profile name of `AmazonCloudWatchAgent`.

To create the `AmazonCloudWatchAgent` profile for the CloudWatch agent

- Type the following command and follow the prompts:

```
aws configure --profile AmazonCloudWatchAgent
```

Create the CloudWatch Agent Configuration File

CloudWatch agent uses a configuration file to specify the metrics to be collected and other agent configuration data. You must customize this file before you start the agent. For more information, see [Create the CloudWatch Agent Configuration File](#) (p. 69).

Start the CloudWatch Agent

You can start the CloudWatch agent using either Systems Manager Run Command or the command line.

To use the SSM Agent to start the CloudWatch agent on an on-premises server

1. Open the Systems Manager console at <https://console.aws.amazon.com/systems-manager/>.

2. In the navigation pane, choose **Run Command**.

-or-

If the AWS Systems Manager home page opens, scroll down and choose **Explore Run Command**.

3. Choose **Run command**.
4. In the **Command document** list, select the button next to **AmazonCloudWatch-ManagedAgent**.
5. In the **Targets** area, select the instance where you installed the agent.
6. In the **Action** list, choose **configure**.
7. In the **Mode** list, choose **onPremise**.
8. In the **Optional Configuration Location** box, type the name of the agent configuration file that you created with the wizard and stored in Parameter Store.
9. Choose **Run**.

The agent starts with the configuration that you specified in the configuration file.

To use the command line to start the CloudWatch agent on an on-premises server

- On a Linux server, type the following if you saved the agent configuration file in Parameter Store:

```
sudo /opt/aws/amazon-cloudwatch-agent-ctl -a fetch-config -m onPremise -c  
ssm:configuration-parameter-store-name -s
```

On a Linux server, type the following if you saved the agent configuration file on the local computer:

```
sudo /opt/aws/amazon-cloudwatch-agent-ctl -a fetch-config -m onPremise -c  
file:configuration-file-path -s
```

On a server running Windows Server, type the following if you saved the agent configuration file in Parameter Store:

```
amazon-cloudwatch-agent-ctl.ps1 -a fetch-config -m onPremise -c ssm:configuration-  
parameter-store-name -s
```

On a server running Windows Server, type the following if you saved the agent configuration file on the local computer:

```
amazon-cloudwatch-agent-ctl.ps1 -a fetch-config -m onPremise -c file:configuration-  
file-path -s
```

Verify the Signature of the CloudWatch Agent Package

GPG signature files are included for CloudWatch Agent assets compressed in ZIP archives. The public key is here: <https://s3.amazonaws.com/amazoncloudwatch-agent/assets/amazon-cloudwatch-agent.gpg>. You can use the public key to verify that the agent's ZIP archive is original and unmodified. First, import the public key with <https://gnupg.org/index.html>.

To verify the CloudWatch agent package on a Linux server

1. Download the public key.

```
shell$ wget https://s3.amazonaws.com/amazoncloudwatch-agent/assets/amazon-cloudwatch-agent.gpg
```

2. Import the public key into your keyring.

```
shell$ gpg --import amazon-cloudwatch-agent.gpg
gpg: key 3B789C72: public key "Amazon CloudWatch Agent" imported
gpg: Total number processed: 1
gpg: imported: 1 (RSA: 1)
```

Make a note of the key value, as you need it in the next step. In the preceding example, the key value is 3B789C72.

3. Verify the fingerprint by running the following command, replacing *key-value* with the value from the preceding step:

```
shell$ gpg --fingerprint key-value
pub 2048R/3B789C72 2017-11-14
    Key fingerprint = 9376 16F3 450B 7D80 6CBD 9725 D581 6730 3B78 9C72
uid                               Amazon CloudWatch Agent
```

The fingerprint string should be equal to the following:

9376 16F3 450B 7D80 6CBD 9725 D581 6730 3B78 9C72

If the fingerprint string does not match, do not install the agent, and contact Amazon Web Services.

After you have verified the fingerprint, you can use it to verify the signature of the CloudWatch agent package.

4. Download the package signature file.

```
wget https://s3.amazonaws.com/amazoncloudwatch-agent/linux/amd64/latest/AmazonCloudWatchAgent.sig
```

5. To verify the signature, run `gpg --verify`.

```
shell$ gpg --verify AmazonCloudWatchAgent.sig AmazonCloudWatchAgent.zip
gpg: Signature made Wed 29 Nov 2017 03:00:59 PM PST using RSA key ID 3B789C72
gpg: Good signature from "Amazon CloudWatch Agent"
gpg: WARNING: This key is not certified with a trusted signature!
gpg:          There is no indication that the signature belongs to the owner.
Primary key fingerprint: 9376 16F3 450B 7D80 6CBD 9725 D581 6730 3B78 9C72
```

If the output includes the phrase `BAD signature`, check whether you performed the procedure correctly. If you continue to get this response, contact Amazon Web Services and avoid unzipping the downloaded agent archive.

Note the warning about trust. A key is only trusted if you or someone that you trust has signed it. This does not mean that the signature is invalid, only that you have not verified the public key.

To verify the CloudWatch agent package on a server running Windows Server

1. Download and install GnuPG for Windows from <https://gnupg.org/download/>. When installing, include the **Shell Extension (GpgEx)** option.

The remaining steps can be performed in Windows PowerShell.

2. Download the public key.

```
PS> wget https://s3.amazonaws.com/amazoncloudwatch-agent/assets/amazon-cloudwatch-agent.gpg -OutFile amazon-cloudwatch-agent.gpg
```

3. Import the public key into your keyring.

```
PS> gpg --import amazon-cloudwatch-agent.gpg
gpg: key 3B789C72: public key "Amazon CloudWatch Agent" imported
gpg: Total number processed: 1
gpg: imported: 1 (RSA: 1)
```

Make a note of the key value, as you need it in the next step. In the preceding example, the key value is 3B789C72.

4. Verify the fingerprint by running the following command, replacing *key-value* with the value from the preceding step:

```
PS> gpg --fingerprint key-value
pub   rsa2048 2017-11-14 [SC]
      9376 16F3 450B 7D80 6CBD  9725 D581 6730 3B78 9C72
uid           [ unknown] Amazon CloudWatch Agent
```

The fingerprint string should be equal to the following:

9376 16F3 450B 7D80 6CBD 9725 D581 6730 3B78 9C72

If the fingerprint string does not match, do not install the agent, and contact Amazon Web Services.

After you have verified the fingerprint, you can use it to verify the signature of the CloudWatch agent package.

5. Download the package signature file.

```
wget https://s3.amazonaws.com/amazoncloudwatch-agent/windows/amd64/latest/AmazonCloudWatchAgent.sig
```

6. To verify the signature, run `gpg --verify`.

```
PS> gpg --verify AmazonCloudWatchAgent.sig AmazonCloudWatchAgent.zip
gpg: Signature made 11/29/17 23:00:45 Coordinated Universal Time
gpg:          using RSA key D58167303B789C72
gpg: Good signature from "Amazon CloudWatch Agent" [unknown]
gpg: WARNING: This key is not certified with a trusted signature!
gpg:          There is no indication that the signature belongs to the owner.
Primary key fingerprint: 9376 16F3 450B 7D80 6CBD  9725 D581 6730 3B78 9C72
```

If the output includes the phrase `BAD signature`, check whether you performed the procedure correctly. If you continue to get this response, contact Amazon Web Services and avoid unzipping the downloaded agent archive.

Note the warning about trust. A key is only trusted if you or someone that you trust has signed it. This does not mean that the signature is invalid, only that you have not verified the public key.

Installing CloudWatch Agent on Additional Servers Using Your Agent Configuration

Topics

- [Download the CloudWatch Agent on an On-Premises Server \(p. 66\)](#)
- [Modify the Common Configuration and Named Profile for CloudWatch Agent \(p. 67\)](#)
- [Start the CloudWatch Agent \(p. 68\)](#)

Download the CloudWatch Agent on an On-Premises Server

To download the CloudWatch agent, you can use AWS Systems Manager or the command line.

To use Systems Manager Run Command, you must register your on-premises server with Amazon EC2 Systems Manager. For more information, see [Setting Up Systems Manager in Hybrid Environments](#) in the *AWS Systems Manager User Guide*.

If you have already registered your server, update your SSM Agent to the latest version.

For information about updating the SSM Agent on a server running Linux, see [Install the SSM Agent on Servers and VMs in Your Linux Hybrid Environment](#) in the *AWS Systems Manager User Guide*.

For information about updating the SSM Agent on a server running Windows Server, see [Install the SSM Agent on Servers and VMs in Your Windows Hybrid Environment](#) in the *AWS Systems Manager User Guide*.

To use the SSM Agent to download the CloudWatch agent package on an on-premises server

1. Open the Systems Manager console at <https://console.aws.amazon.com/systems-manager/>.
2. In the navigation pane, choose **Run Command**.

-or-

If the AWS Systems Manager home page opens, scroll down and choose **Explore Run Command**.

3. Choose **Run command**.
4. In the **Command document** list, select the button next to **AWS-ConfigureAWSPackage**.
5. In the **Targets** area, select the server on which to install the CloudWatch agent. If you do not see a specific server, it might not be configured for Run Command. For more information, see [Systems Manager Prerequisites](#) in the *Amazon EC2 User Guide for Windows Instances*.
6. In the **Action** list, choose **Install**.
7. In the **Name** box, type **AmazonCloudWatchAgent**.
8. Leave **Version** blank to install the latest version of the agent.
9. Choose **Run**.

The agent package is downloaded, and the next steps are to configure and start it.

To use the command line to download the CloudWatch agent on an on-premises server

1. Make a directory for downloading and unzipping the agent package. For example, `tmp/AmazonCloudWatchAgent`. Then change into that directory.
2. Download the CloudWatch agent package. For a Linux server, type the following:

```
wget https://s3.amazonaws.com/amazoncloudwatch-agent/linux/amd64/latest/AmazonCloudWatchAgent.zip
```

For a server running Windows Server, download the following file:

```
https://s3.amazonaws.com/amazoncloudwatch-agent/windows/amd64/latest/  
AmazonCloudWatchAgent.zip
```

3. After you have downloaded the package, you can optionally use a GPG signature file to verify the package signature. For more information, see [Verify the Signature of the CloudWatch Agent Package \(p. 63\)](#).
4. Unzip the package.

```
unzip AmazonCloudWatchAgent.zip
```

5. Install the package. On a Linux server, change to the directory containing the package and type:

```
sudo ./install.sh
```

On a server running Windows Server, open PowerShell, change to the directory containing the unzipped package, and use the `install.ps1` script to install it.

Modify the Common Configuration and Named Profile for CloudWatch Agent

The CloudWatch agent package you have downloaded includes a configuration file called `common-config.toml`. You can use this file to specify proxy, credential, and region information. On a server running Linux, this file is in the `/opt/aws/amazon-cloudwatch-agent/etc` directory. On a server running Windows Server, this file is in the `C:\ProgramData\Amazon\AmazonCloudWatchAgent` directory.

The default `common-config.toml` is as follows:

```
# This common-config is used to configure items used for both ssm and cloudwatch access

## Configuration for shared credential.
## Default credential strategy will be used if it is absent here:
##           Instance role is used for EC2 case by default.
##           AmazonCloudWatchAgent profile is used for onPremise case by default.
# [credentials]
#   shared_credential_profile = "{profile_name}"

## Configuration for proxy.
## System-wide environment-variable will be read if it is absent here.
## i.e. HTTP_PROXY/http_proxy; HTTPS_PROXY/https_proxy; NO_PROXY/no_proxy
## Note: system-wide environment-variable is not accessible when using ssm run-command.
## Absent in both here and environment-variable means no proxy will be used.
# [proxy]
#   http_proxy = "{http_url}"
#   https_proxy = "{https_url}"
#   no_proxy = "{domain}"
```

All lines are commented out initially. To set the credential profile or proxy settings, remove the `#` from that line and specify a value. You can edit this file manually, or by using the `RunShellScript` Run Command in Systems Manager:

- **shared_credential_profile** You can specify a name for the named profile that CloudWatch agent is to look for in the AWS credentials and AWS config files. If you don't specify a name here, the CloudWatch agent looks for the default profile name, `AmazonCloudWatchAgent`.
- **proxy settings** If your servers use HTTP or HTTPS proxies to contact AWS services, specify those proxies in the `http_proxy` and `https_proxy` fields. If there are URLs that should be excluded from proxying, specify them in the `no_proxy` field, separated by commas.

After modifying `common-config.toml`, you should make sure that the profile name specified, or the default profile name of `AmazonCloudWatchAgent`, exists in the root user's AWS credentials and config files. This profile is used for credential and region information during CloudWatch agent setup. Following is an example of this profile in the credentials file:

```
[AmazonCloudWatchAgent]
aws_access_key_id=my_access_key
aws_secret_access_key=my_secret_key
```

For `my_access_key` and `my_secret_key`, use the keys from the IAM user that does not have the permissions to write to Systems Manager Parameter Store. For more information about the IAM users needed for CloudWatch agent, see [Create IAM Users to Use with CloudWatch Agent on On-premises Servers](#) (p. 48).

Following is an example of the profile for the configuration file:

```
[AmazonCloudWatchAgent]
region=us-west-1
```

The named profile in the credentials file contains the credentials to be used for CloudWatch agent. These credentials are used for permissions to write metric data to CloudWatch, and to download information from Systems Manager Parameter Store during the CloudWatch agent installation. You can obtain the credentials to use for this section by creating an IAM user for the CloudWatch agent, as explained previously in this section.

The named profile in the configuration file specifies the region to which the CloudWatch metrics are published, when the CloudWatch agent runs on an on-premises server. When you use the `aws configure` command to modify the profile, do so as the root or administrator.

Following is an example of using the `aws configure` command to create a named profile for the CloudWatch agent. This example assumes that you are using the default profile name of `AmazonCloudWatchAgent`.

To create the `AmazonCloudWatchAgent` profile for the CloudWatch agent

- Type the following command and follow the prompts:

```
aws configure --profile AmazonCloudWatchAgent
```

Start the CloudWatch Agent

You can start the CloudWatch agent using either Systems Manager Run Command or the command line.

To use the SSM Agent to start the CloudWatch agent on an on-premises server

1. Open the Systems Manager console at <https://console.aws.amazon.com/systems-manager/>.
2. In the navigation pane, choose **Run Command**.

-or-

If the AWS Systems Manager home page opens, scroll down and choose **Explore Run Command**.

3. Choose **Run command**.
4. In the **Command document** list, select the button next to **AmazonCloudWatch-ManageAgent**.
5. In the **Targets** area, select the instance where you installed the agent.
6. In the **Action** list, choose **configure**.
7. In the **Mode** list, choose **onPremise**.
8. In the **Optional Configuration Location** box, type the name of the agent configuration file that you created with the wizard and stored in the Parameter Store.
9. Choose **Run**.

The agent starts with the configuration you specified in the configuration file.

To use the command line to start the CloudWatch agent on an on-premises server

- On a Linux server, type the following if you saved the agent configuration file in Parameter Store:

```
sudo /opt/aws/amazon-cloudwatch-agent-ctl -a fetch-config -m onPremise -c  
ssm:configuration-parameter-store-name -s
```

On a Linux server, type the following if you saved the agent configuration file on the local computer:

```
sudo /opt/aws/amazon-cloudwatch-agent-ctl -a fetch-config -m onPremise -c  
file:configuration-file-path -s
```

On a server running Windows Server, type the following if you saved the agent configuration file in Parameter Store:

```
amazon-cloudwatch-agent-ctl.ps1 -a fetch-config -m onPremise -c ssm:configuration-  
parameter-store-name -s
```

On a server running Windows Server, type the following if you saved the agent configuration file on the local computer:

```
amazon-cloudwatch-agent-ctl.ps1 -a fetch-config -m onPremise -c file:configuration-  
file-path -s
```

Create the CloudWatch Agent Configuration File

Whether you are installing the CloudWatch agent on an Amazon EC2 instance or an on-premises server, you must create the CloudWatch agent configuration file before starting the agent.

The agent configuration file is a JSON file that specifies the metrics and logs that the agent is to collect. You can create it by using the wizard, or by creating it yourself from scratch. You could also use the wizard to initially create the configuration file, and then modify it manually.

If you create or modify it manually the process is more complex, but you have more control over the metrics collected, and can specify metrics not used by the wizard.

Any time you change the agent configuration file, you must then restart the agent to have the changes take effect.

After you have created a configuration file, you can store it in Systems Manager Parameter Store. This enables you to use the same agent configuration on other servers.

Contents

- [Create the CloudWatch Agent Configuration File with the Wizard \(p. 70\)](#)
- [Manually Create or Edit the CloudWatch Agent Configuration File \(p. 74\)](#)

Create the CloudWatch Agent Configuration File with the Wizard

The agent configuration file wizard, `amazon-cloudwatch-agent-config-wizard`, asks a series of questions, including the following:

- Are you installing the agent on an Amazon EC2 instance or an on-premises server?
- Is the server running Linux or Windows Server?
- Do you want the agent to also send log files to CloudWatch Logs? If so, do you have an existing CloudWatch Logs agent configuration file? If yes, the CloudWatch agent can use this file to determine the logs to collect from the server.
- If you are going to collect metrics from the server, do you want to monitor one of the default sets of metrics, or customize the list of metrics that you collect?
- Are you migrating from an existing SSM Agent?

The wizard can autodetect the credentials and AWS region to use, if you have the AWS credentials and configuration files in place before you start the wizard. For more information about these files, see [Configuration and Credential Files](#) in the *AWS Systems Manager User Guide*.

The wizard looks for an `AmazonCloudWatchAgent` section such as this in the credentials file:

```
[AmazonCloudWatchAgent]
aws_access_key_id=my_secret_key
aws_secret_access_key=my_access_key
```

If this section exists, the wizard uses these credentials for the CloudWatch agent.

For `my_access_key` and `my_secret_key`, use the keys from the IAM user that has the permissions to write to Systems Manager Parameter Store. For more information about the IAM users needed for CloudWatch agent, see [Create IAM Users to Use with CloudWatch Agent on On-premises Servers \(p. 48\)](#).

In the configuration file, you can specify what region the agent sends metrics to, if it is different than the region in the `[default]` section. The default is to publish the metrics to region where the Amazon EC2 instance is located. If the metrics should be published to a different region, specify the region here. In the following example, the metrics are published to the `us-west-1` region.

```
[AmazonCloudWatchAgent]
region=us-west-1
```

CloudWatch Agent Predefined Metric Sets

The wizard is configured with pre-defined sets of metrics, with different detail levels. These sets of metrics are shown in the following tables. For more information about these metrics, see [Metrics Collected by the CloudWatch Agent \(p. 108\)](#).

Amazon EC2 instances running Linux

Detail Level	Metrics Included
Basic	Mem: mem_used_percent Swap: swap_used_percent
Standard	CPU: cpu_usage_idle, cpu_usage_iowait, cpu_usage_user, cpu_usage_system Disk: disk_used_percent, disk_inodes_free, diskio_io_time Mem: mem_used_percent Swap: swap_used_percent
Advanced	CPU: cpu_usage_idle, cpu_usage_iowait, cpu_usage_user, cpu_usage_system Disk: disk_used_percent, disk_inodes_free Diskio: diskio_io_time, diskio_write_bytes, diskio_read_bytes, diskio_writes, diskio_reads Mem: mem_used_percent Netstat: netstat_tcp_established, netstat_tcp_time_wait Swap: swap_used_percent

On-premises servers running Linux

Detail Level	Metrics Included
Basic	Disk: disk_used_percent Diskio: diskio_write_bytes, diskio_read_bytes, diskio_writes, diskio_reads Mem: mem_used_percent Net: net_bytes_sent, net_bytes_recv, net_packets_sent, net_packets_recv Swap: swap_used_percent
Standard	CPU: cpu_usage_idle, cpu_usage_iowait Disk: disk_used_percent, disk_inodes_free Diskio: diskio_io_time, diskio_write_bytes, diskio_read_bytes, diskio_writes, diskio_reads Mem: mem_used_percent Net: net_bytes_sent, net_bytes_recv, net_packets_sent, net_packets_recv Swap: swap_used_percent
Advanced	CPU: cpu_usage_idle, cpu_usage_guest, cpu_usage_iowait, cpu_usage_steal, cpu_usage_user, cpu_usage_system

Detail Level	Metrics Included
	Disk: disk_used_percent, disk_inodes_free Diskio: diskio_io_time, diskio_write_bytes, diskio_read_bytes, diskio_writes, diskio_reads Mem: mem_used_percent Net: net_bytes_sent, net_bytes_recv, net_packets_sent, net_packets_recv Netstat: netstat_tcp_established, netstat_tcp_time_wait, Swap: swap_used_percent

Amazon EC2 instances running Windows Server

Detail Level	Metrics Included
Basic	Memory: Memory % Committed Bytes In Use Paging: Paging File % Usage
Standard	Memory: Memory % Committed Bytes In Use Paging: Paging File % Usage Processor: Processor % Idle Time, Processor % Interrupt Time, Processor % User Time, PhysicalDisk: PhysicalDisk % Disk Time LogicalDisk: LogicalDisk % Free Space
Advanced	Memory: Memory % Committed Bytes In Use Paging: Paging File % Usage Processor: Processor % Idle Time, Processor % Interrupt Time, Processor % User Time LogicalDisk: LogicalDisk % Free Space PhysicalDisk: PhysicalDisk % Disk Time, PhysicalDisk Disk Write Bytes/sec, PhysicalDisk Disk Read Bytes/sec, PhysicalDisk Disk Writes/sec, PhysicalDisk Disk Reads/sec TCP: TCPv4 Connections Established, TCPv6 Connections Established

On-premises server running Windows Server

Detail Level	Metrics Included
Basic	Processor: Processor % Processor Time Paging: Paging File % Usage LogicalDisk: LogicalDisk % Free Space

Detail Level	Metrics Included
	<p>PhysicalDisk: PhysicalDisk Disk Write Bytes/sec, PhysicalDisk Disk Read Bytes/sec, PhysicalDisk Disk Writes/sec, PhysicalDisk Disk Reads/sec</p> <p>Memory: Memory % Committed Bytes In Use</p> <p>Network Interface: Network Interface Bytes Sent/sec, Network Interface Bytes Received/sec, Network Interface Packets Sent/sec, Network Interface Packets Received/sec</p>
Standard	<p>Paging: Paging File % Usage</p> <p>Processor: Processor_% Processor Time, Processor % Idle Time Processor % Interrupt Time</p> <p>LogicalDisk: LogicalDisk % Free Space</p> <p>PhysicalDisk: PhysicalDisk % Disk Time, PhysicalDisk Disk Write Bytes/sec, PhysicalDisk Disk Read Bytes/sec, PhysicalDisk Disk Writes/sec, PhysicalDisk Disk Reads/sec</p> <p>Memory: Memory % Committed Bytes In Use</p> <p>Network Interface: Network Interface Bytes Sent/sec, Network Interface Bytes Received/sec, Network Interface Packets Sent/sec, Network Interface Packets Received/sec</p>
Advanced	<p>Paging:Paging File % Usage</p> <p>Processor: Processor % Processor Time, Processor % Idle Time, Processor % Interrupt Time, Processor % User Time</p> <p>LogicalDisk: LogicalDisk % Free Space</p> <p>PhysicalDisk: PhysicalDisk % Disk Time, PhysicalDisk Disk Write Bytes/sec, PhysicalDisk Disk Read Bytes/sec, PhysicalDisk Disk Writes/sec, PhysicalDisk Disk Reads/sec</p> <p>Memory: Memory % Committed Bytes In Use</p> <p>Network Interface: Network Interface Bytes Sent/sec, Network Interface Bytes Received/sec, Network Interface Packets Sent/sec, Network Interface Packets Received/sec</p> <p>TCP: TCPv4 Connections Established, TCPv6 Connections Established</p>

Running the CloudWatch Agent Configuration Wizard

To create the CloudWatch agent configuration file

1. Start the CloudWatch agent configuration wizard by typing the following:

```
sudo /opt/aws/amazon-cloudwatch-agent/bin/amazon-cloudwatch-agent-config-wizard
```

On a server running Windows Server, type the following:

```
cd "C:\Program Files\Amazon\AmazonCloudWatchAgent"
```

```
amazon-cloudwatch-agent-config-wizard.exe
```

2. Answer the questions to customize the configuration file for your server.
3. If you are going to use Systems Manager to install and configure the agent, be sure to answer **Yes** when prompted whether to store the file in Systems Manager Parameter Store. You can also choose to store the file in Parameter Store even if you aren't using the SSM Agent to install the CloudWatch agent. To be able to store the file in Parameter Store, you must use an IAM role with sufficient permissions. For more information, see [Create IAM Roles and Users for Use With CloudWatch Agent](#) (p. 46).

If you are storing the configuration file locally, you can store it anywhere. You will then specify the file location when you start the agent.

Manually Create or Edit the CloudWatch Agent Configuration File

The CloudWatch agent configuration file is a JSON file with three sections: agent, metrics, and logs.

- The **agent** section includes fields for overall configuration of the agent. If you use the wizard, it does not create an agent section.
- The **metrics** section specifies the custom metrics for collection and publishing to CloudWatch. If you are using the agent only to collect logs, you can omit the metrics section from the file.
- The **logs** section specifies what log files are published to CloudWatch Logs. This can include events from the Windows Event Log, if the server runs Windows Server.

The following sections explain the structure and fields of this JSON file. You can also view the schema definition for this configuration file. The schema definition is located at *installation-directory/doc/amazon-cloudwatch-agent-schema.json* on Linux servers, and at *installation-directory/amazon-cloudwatch-agent-schema.json* on servers running Windows Server.

If you create or edit the JSON file manually, you can give it any name. For simplicity in troubleshooting, we suggest you name it */opt/aws/amazon-cloudwatch-agent/etc/amazon-cloudwatch-agent.json* on Linux server and *\$Env:ProgramData\Amazon\AmazonCloudWatchAgent\amazon-cloudwatch-agent.json* on servers running Windows Server.

CloudWatch Agent Configuration File: Agent Section

The **agent** section can include the fields listed below. The wizard does not create an agent section. Instead, the wizard omits it and uses the default values for all fields in this section.

- **metrics_collection_interval** – Optional. Specifies how often all metrics specified in this configuration file are to be collected. This value can be overridden for specific types of metrics.

This is specified in seconds. For example, specifying 10 sets metrics to be collected every 10 seconds, and setting it to 300 specifies metrics to be collected every 5 minutes.

If you set this value below 60 seconds, each metric is collected as a high-resolution metric. For more information about high-resolution metrics, see [High-Resolution Metrics](#) (p. 42).

The default is 60.

- **region** – Specifies the region to use for the CloudWatch endpoint, when an Amazon EC2 instance is being monitored. The metrics collected are sent to this region, such as *us-west-1*. If you omit this field, the agent sends metrics to the region where the Amazon EC2 instance is located.

If you are monitoring an on-premises server, this field is not used, and the agent reads the region from the `awscloudwatchagent` profile of the AWS configuration file.

- **debug** – Optional. Specifies running the CloudWatch agent with debug log messages. The default is `false`.
- **logfile** – Specifies the location where the CloudWatch agent writes log messages. If you specify an empty string, the log goes to `stderr`. If you don't specify this option, the default locations are the following:
 - Linux: `/opt/aws/amazon-cloudwatch-agent/logs/amazon-cloudwatch-agent.log`
 - Windows Server versions later than Windows Server 2003: `c:\ProgramData\Amazon\CloudWatchAgent\Logs\amazon-cloudwatch-agent.log`

Tip

We suggest you set up log rotation for this file so that it doesn't grow and fill the disk.

The following is an example of an agent section:

```
"agent": {
  "metrics_collection_interval": 60,
  "region": "us-west-1",
  "logfile": "/opt/aws/amazon-cloudwatch-agent/logs/amazon-cloudwatch-agent.log",
  "debug": false
}
```

CloudWatch Agent Configuration File: Metrics Section

On servers running either Linux or Windows Server, the **metrics** section includes the following fields:

- **namespace** – Optional. The namespace to use for the metrics collected by the agent. The default is `CWAgent`.
- **append_dimensions** – Optional. Adds Amazon EC2 metric dimensions to all metrics collected by the agent. For each dimension, you must specify a key-value pair, where the key matches an Amazon EC2 dimension: `ImageID: image-id`, `InstanceId: instance-id`, `InstanceType: instance-type`, or `AutoScalingGroupName: AutoScaling-group-name`.
- **aggregation_dimensions** – Specifies the dimensions on which collected metrics are to be aggregated. For example, if you roll up metrics on the `AutoScalingGroupName` dimension, the metrics from all instances in each Auto Scaling group are aggregated and can be viewed as a whole.

You can roll up metrics along single or multiple dimensions. For example, specifying `[["InstanceId"], ["InstanceType"], ["InstanceId", "InstanceType"]]` aggregates metrics for Instance ID singly, Instance Type singly, and for the combination of the two dimensions.

You can also specify `[]` to roll up all metrics into one collection, disregarding all dimensions.

- **metrics_collected** – Required. Specifies which metrics are to be collected. This section includes several subsections.

The contents of the `metrics_collected` section depend on whether this configuration file is for a server running Linux or Windows Server.

Linux

On servers running Linux, the **metrics_collected** section of the configuration file can also contain the following fields:

- **cpu** – Optional. Specifies that cpu metrics are to be collected. This section is valid only for Linux instances. This section can include as many as three fields:
 - **resources** – Optional. Specifies that per-cpu metrics are to be collected. The only allowed value is *. If you include this field and value, per-cpu metrics are collected.
 - **totalcpu** – Optional. Specifies whether to report cpu metrics aggregated across all cpu cores. The default is true.
 - **measurement** – Specifies the array of cpu metrics to be collected. Possible values are `time_active`, `time_guest`, `time_guest_nice`, `time_idle`, `time_iowait`, `time_irq`, `time_nice`, `time_softirq`, `time_steal`, `time_system`, `time_user`, `usage_guest`, `usage_guest_nice`, `usage_idle`, `usage_iowait`, `usage_irq`, `usage_nice`, `usage_softirq`, `usage_steal`, `usage_system`, and `usage_user`. This field is required if you include `cpu`.

By default, the unit for `cpu_usage_*` metrics is `Percent`, and `cpu_time_*` metrics do not have a unit.

Within the entry for each individual metric, you may optionally specify one or both of the following:

- **rename** – Specifies a different name for this metric.
- **unit** – Specifies the unit to use for this metric, overriding the default unit for the metric. The unit that you specify must be a valid CloudWatch metric unit, as listed in the `Unit` description in [MetricDatum](#)
- **metrics_collection_interval** – Optional. Specifies how often to collect the cpu metrics, overriding the global `metrics_collection_interval` specified in the `agent` section of the configuration file.

This is specified in seconds. For example, specifying 10 sets metrics to be collected every 10 seconds, and setting it to 300 specifies metrics to be collected every 5 minutes.

If you set this value below 60 seconds, each metric is collected as a high-resolution metric. For more information about high-resolution metrics, see [High-Resolution Metrics \(p. 42\)](#).

- **append_dimensions** – Optional. Additional dimensions to use for only the cpu metrics. If you specify this field, it is used in addition to dimensions specified in the global `append_dimensions` field that is used for all types of metrics collected by the agent.
- **disk** – Optional. Specifies that disk metrics are to be collected. This section is valid only for Linux instances. This section can include as many as two fields:
 - **resources** – Optional. Specifies disk mount points. This field limits CloudWatch to collect metrics from only the listed mount points. You can specify * as the value to collect metrics from all mount points. The default is to collect metrics from all mount points.
 - **measurement** – Specifies the array of disk metrics to be collected. Possible values are `free`, `total`, `used`, `used_percent`, `inodes_free`, `inodes_used`, and `inodes_total`. This field is required if you include `disk`.

To see the default units for each disk metric, see [Metrics Collected by the CloudWatch Agent on Linux Instances \(p. 108\)](#).

Within the entry for each individual metric, you may optionally specify one or both of the following:

- **rename** – Specifies a different name for this metric.
- **unit** – Specifies the unit to use for this metric, overriding the default unit for the metric. The unit that you specify must be a valid CloudWatch metric unit, as listed in the `Unit` description in [MetricDatum](#)
- **metrics_collection_interval** – Optional. Specifies how often to collect the disk metrics, overriding the global `metrics_collection_interval` specified in the `agent` section of the configuration file.

This is specified in seconds.

If you set this value below 60 seconds, each metric is collected as a high-resolution metric. For more information about high-resolution metrics, see [High-Resolution Metrics \(p. 42\)](#).

- **append_dimensions** – Optional. Additional dimensions to use for only the disk metrics. If you specify this field, it is used in addition to dimensions specified in the `append_dimensions` field that is used for all types of metrics collected by the agent
- **diskio** – Optional. Specifies that diskio metrics are to be collected. This section is valid only for Linux instances. This section can include as many as two fields:
 - **resources** – Optional. If you specify an array of devices, CloudWatch collects metrics from only those devices. Otherwise, metrics for all devices are collected. You can also specify `*` as the value to collect metrics from all devices.
 - **measurement** – Specifies the array of diskio metrics to be collected. Possible values are `reads`, `writes`, `read_bytes`, `write_bytes`, `read_time`, `write_time`, `io_time`, and `iops_in_progress`. This field is required if you include `diskio`.

To see the default units for each `diskio` metric, see [Amazon EC2 Metrics and Dimensions \(p. 133\)](#).

Within the entry for each individual metric, you may optionally specify one or both of the following:

- **rename** – Specifies a different name for this metric.
- **unit** – Specifies the unit to use for this metric, overriding the default unit for the metric. The unit you specify must be a valid CloudWatch metric unit, as listed in the `unit` description in [MetricDatum](#)
- **metrics_collection_interval** – Optional. Specifies how often to collect the diskio metrics, overriding the global `metrics_collection_interval` specified in the `agent` section of the configuration file.

This is specified in seconds.

If you set this value below 60 seconds, each metric is collected as a high-resolution metric. For more information about high-resolution metrics, see [High-Resolution Metrics \(p. 42\)](#).

- **append_dimensions** – Optional. Additional dimensions to use for only the diskio metrics. If you specify this field, it is used in addition to dimensions specified in the `append_dimensions` field that is used for all types of metrics collected by the agent.
- **swap** – Optional. Specifies that swap memory metrics are to be collected. This section is valid only for Linux instances. This section can include one field:
 - **measurement** – Specifies the array of swap metrics to be collected. Possible values are `free`, `used`, and `used_percent`. This field is required if you include `swap`.

To see the default units for each swap metric, see [Metrics Collected by the CloudWatch Agent on Linux Instances \(p. 108\)](#).

Within the entry for each individual metric, you may optionally specify one or both of the following:

- **rename** Specifies a different name for this metric.
- **unit** – Specifies the unit to use for this metric, overriding the default unit for the metric. The unit you specify must be a valid CloudWatch metric unit, as listed in the `unit` description in [MetricDatum](#)
- **metrics_collection_interval** – Optional. Specifies how often to collect the swap metrics, overriding the global `metrics_collection_interval` specified in the `agent` section of the configuration file.

This is specified in seconds.

If you set this value below 60 seconds, each metric is collected as a high-resolution metric. For more information about high-resolution metrics, see [High-Resolution Metrics \(p. 42\)](#).

- **append_dimensions** Optional. Additional dimensions to use for only the swap metrics. If you specify this field, it is used in addition to dimensions specified in the global `append_dimensions` field that is used for all types of metrics collected by the agent. is collected as a high-resolution metric.
- **mem** – Optional. Specifies that memory metrics are to be collected. This section is valid only for Linux instances. This section can include one field:
 - **measurement** – Specifies the array of swap metrics to be collected. Possible values are `active`, `available`, `available_percent`, `buffered`, `cached`, `free`, `inactive`, `total`, `used`, and `used_percent`. This field is required if you include `mem`.

To see the default units for each `mem` metric, see [Metrics Collected by the CloudWatch Agent on Linux Instances \(p. 108\)](#).

Within the entry for each individual metric, you may optionally specify one or both of the following:

- **rename** – Specifies a different name for this metric.
- **unit** – Specifies the unit to use for this metric, overriding the default unit for the metric. The unit that you specify must be a valid CloudWatch metric unit, as listed in the `Unit` description in [MetricDatum](#)
- **metrics_collection_interval** – Optional. Specifies how often to collect the `mem` metrics, overriding the global `metrics_collection_interval` specified in the `agent` section of the configuration file.

This is specified in seconds.

If you set this value below 60 seconds, each metric is collected as a high-resolution metric. For more information about high-resolution metrics, see [High-Resolution Metrics \(p. 42\)](#).

- **append_dimensions** – Optional. Additional dimensions to use for only the `mem` metrics. If you specify this field, it is used in addition to dimensions specified in the `append_dimensions` field that is used for all types of metrics collected by the agent.
- **net** – Optional. Specifies that networking metrics are to be collected. This section is valid only for Linux instances. This section can include as many as two fields:
 - **resources** – Optional. If you specify an array of network interfaces, CloudWatch collects metrics from only those interfaces. Otherwise, metrics for all devices are collected. You can also specify `*` as the value to collect metrics from all interfaces.
 - **measurement** – Specifies the array of networking metrics to be collected. Possible values are `bytes_sent`, `bytes_recv`, `drop_in`, `drop_out`, `err_in`, `err_out`, `packets_sent`, and `packets_recv`. This field is required if you include `net`.

To see the default units for each `net` metric, see [Metrics Collected by the CloudWatch Agent on Linux Instances \(p. 108\)](#).

Within the entry for each individual metric, you may optionally specify one or both of the following:

- **rename** – Specifies a different name for this metric.
- **unit** – Specifies the unit to use for this metric, overriding the default unit for the metric. The unit you specify must be a valid CloudWatch metric unit, as listed in the `Unit` description in [MetricDatum](#)
- **metrics_collection_interval** – Optional. Specifies how often to collect the `net` metrics, overriding the global `metrics_collection_interval` specified in the `agent` section of the configuration file.

This is specified in seconds. For example, specifying 10 sets metrics to be collected every 10 seconds, and setting it to 300 specifies metrics to be collected every 5 minutes.

If you set this value below 60 seconds, each metric is collected as a high-resolution metric. For more information about high-resolution metrics, see [High-Resolution Metrics \(p. 42\)](#).

- **append_dimensions** – Optional. Additional dimensions to use for only the net metrics. If you specify this field, it is used in addition to dimensions specified in the `append_dimensions` field that is used for all types of metrics collected by the agent.
- **netstat** – Optional. Specifies that TCP connection state and UDP connection metrics are to be collected. This section is valid only for Linux instances. This section can include one field:
 - **measurement** – Specifies the array of netstat metrics to be collected. Possible values are `tcp_close`, `tcp_close_wait`, `tcp_closing`, `tcp_established`, `tcp_fin_wait1`, `tcp_fin_wait2`, `tcp_last_ack`, `tcp_listen`, `tcp_none`, `tcp_syn_sent`, `tcp_syn_recv`, `tcp_time_wait`, and `udp_socket`. This field is required if you include `netstat`.

To see the default units for each netstat metric, see [Metrics Collected by the CloudWatch Agent on Linux Instances \(p. 108\)](#).

Within the entry for each individual metric, you may optionally specify one or both of the following:

- **rename** – Specifies a different name for this metric.
- **unit** – Specifies the unit to use for this metric, overriding the default unit for the metric. The unit that you specify must be a valid CloudWatch metric unit, as listed in the `Unit` description in [MetricDatum](#).
- **metrics_collection_interval** – Optional. Specifies how often to collect the netstat metrics, overriding the global `metrics_collection_interval` specified in the agent section of the configuration file.

This is specified in seconds.

If you set this value below 60 seconds, each metric is collected as a high-resolution metric. For more information about high-resolution metrics, see [High-Resolution Metrics \(p. 42\)](#).

- **append_dimensions** – Optional. Additional dimensions to use for only the netstat metrics. If you specify this field, it is used in addition to dimensions specified in the `append_dimensions` field that is used for all types of metrics collected by the agent.
- **processes** – Optional. Specifies that process metrics are to be collected. This section is valid only for Linux instances. This section can include one field:
 - **measurement** – Specifies the array of processes metrics to be collected. Possible values are `blocked`, `dead`, `idle`, `paging`, `running`, `sleeping`, `stopped`, `total`, `total_threads`, `wait`, and `zombie`. This field is required if you include `processes`.

For all processes metrics, the default unit is Count.

Within the entry for each individual metric, you may optionally specify one or both of the following:

- **rename** – Specifies a different name for this metric.
- **unit** – Specifies the unit to use for this metric, overriding the default unit for the metric. The unit you specify must be a valid CloudWatch metric unit, as listed in the `Unit` description in [MetricDatum](#).
- **metrics_collection_interval** – Optional. Specifies how often to collect the processes metrics, overriding the global `metrics_collection_interval` specified in the agent section of the configuration file.

This is specified in seconds. For example, specifying 10 sets metrics to be collected every 10 seconds, and setting it to 300 specifies metrics to be collected every 5 minutes.

If you set this value below 60 seconds, each metric is collected as a high-resolution metric. For more information, see [High-Resolution Metrics \(p. 42\)](#).

- **append_dimensions** – Optional. Additional dimensions to use for only the process metrics. If you specify this field, it is used in addition to dimensions specified in the `append_dimensions` field that is used for all types of metrics collected by the agent.

The following is an example of a `metrics` section for a Linux server:

```
"metrics": {
  "metrics_collected": {
    "cpu": {
      "resources": [
        "*"
      ],
      "measurement": [
        {"name": "cpu_usage_idle", "rename": "CPU_USAGE_IDLE", "unit": "Percent"},
        {"name": "cpu_usage_nice", "unit": "Percent"},
        "cpu_usage_guest"
      ],
      "totalcpu": false,
      "metrics_collection_interval": 10,
      "append_dimensions": {
        "test": "test1",
        "date": "2017-10-01"
      }
    },
    "netstat": {
      "measurement": [
        "tcp_established",
        "tcp_syn_sent",
        "tcp_close"
      ],
      "metrics_collection_interval": 60
    },
    "processes": {
      "measurement": [
        "running",
        "sleeping",
        "dead"
      ]
    }
  },
  "append_dimensions": {
    "ImageId": "${aws:ImageId}",
    "InstanceId": "${aws:InstanceId}",
    "InstanceType": "${aws:InstanceType}",
    "AutoScalingGroupName": "${aws:AutoScalingGroupName}"
  },
  "aggregation_dimensions" : [{"AutoScalingGroupName"}, {"InstanceId", "InstanceType"}],
[]
}
```

Windows Server

In the **metrics_collected** section for Windows Server, you can have subsections for each Windows performance object, such as Memory, Processor, and LogicalDisk. For information about what objects and counters are available, see the Microsoft Windows documentation.

Within the subsection for each object, you specify a `measurement` array of the counters to collect. The `measurement` array is required for each object that you specify in the configuration file. You can also specify a `resources` field to name the instances from which to collect metrics. You can also specify `*` for `resources`, to collect separate metrics for every instance. If you omit `resources`, the data for all instances is aggregated into one set.

Within each object section, you can also specify the following optional fields:

- **metrics_collection_interval** – Optional. Specifies how often to collect the metrics for this object, overriding the global `metrics_collection_interval` specified in the agent section of the configuration file.

This is specified in seconds. For example, specifying 10 sets metrics to be collected every 10 seconds, and setting it to 300 specifies metrics to be collected every 5 minutes.

If you set this value below 60 seconds, each metric is collected as a high-resolution metric. For more information, see [High-Resolution Metrics \(p. 42\)](#).

- **append_dimensions** –Optional. Additional dimensions to use for only the metrics for this object. If you specify this field, it is used in addition to dimensions specified in the global `append_dimensions` field that is used for all types of metrics collected by the agent.

Within each counter section, you can also specify the following optional fields:

- **rename** – Specifies a different name to be used in CloudWatch for this metric.
- **unit** – Specifies the unit to use for this metric. The unit you specify must be a valid CloudWatch metric unit, as listed in the `Unit` description in [MetricDatum](#)

The following is an example `metrics` section for use on Windows Server:

```
"metrics": {
  "metrics_collected": {
    "Processor": {
      "measurement": [
        {"name": "% Idle Time", "rename": "CPU_IDLE", "unit": "Percent"},
        "% Interrupt Time",
        "% User Time",
        "% Processor Time"
      ],
      "resources": [
        "*"
      ],
      "append_dimensions": {
        "d1": "win_foo",
        "d2": "win_bar"
      }
    },
    "LogicalDisk": {
      "measurement": [
        {"name": "% Idle Time", "unit": "Percent"},
        {"name": "% Disk Read Time", "rename": "DISK_READ"},
        "% Disk Write Time"
      ],
      "resources": [
        "*"
      ]
    },
    "Memory": {
      "metrics_collection_interval": 5,
      "measurement": [
        "Available Bytes",
        "Cache Faults/sec",
        "Page Faults/sec",
        "Pages/sec"
      ],
      "append_dimensions": {
        "d3": "win_bo"
      }
    },
    "Network Interface": {
      "metrics_collection_interval": 5,
      "measurement": [
        "Bytes Received/sec",
```

```
        "Bytes Sent/sec",
        "Packets Received/sec",
        "Packets Sent/sec"
    ],
    "resources": [
        "*"
    ],
    "append_dimensions": {
        "d3": "win_bo"
    }
},
"System": {
    "measurement": [
        "Context Switches/sec",
        "System Calls/sec",
        "Processor Queue Length"
    ],
    "append_dimensions": {
        "d1": "win_foo",
        "d2": "win_bar"
    }
}
},
"append_dimensions": {
    "ImageId": "${aws:ImageId}",
    "InstanceId": "${aws:InstanceId}",
    "InstanceType": "${aws:InstanceType}",
    "AutoScalingGroupName": "${aws:AutoScalingGroupName}"
},
"aggregation_dimensions" : [{"ImageId"}, {"InstanceId", "InstanceType"}, {"d1"},[]]
}
```

CloudWatch Agent Configuration File: Logs Section

The **logs** section includes the following fields:

- **logs_collected** – Required if the **logs** section is included. Specifies which log files and Windows event logs are to be collected from the server. It can include two fields, **files** and **windows_events**.
- **files** specifies which regular log files are to be collected by the CloudWatch agent. It contains one field, **collect_list**, which further defines these files.
 - **collect_list** – Required if **files** is included. Contains an array of entries, each of which specifies one log file to collect. Each of these entries can include the following fields:
 - **file_path** – Specifies the path of the log file to upload to CloudWatch Logs. Standard Unix glob matching rules are accepted, with the addition of ****** as a *super asterisk*. For example, specifying `/var/log/**/*.log` causes all `.log` files in the `/var/log` directory tree to be collected. For more examples, see [Glob Library](#).
 - **log_group_name** – Optional. Specifies what to use as the log group name in CloudWatch Logs. Allowed characters include a-z, A-Z, 0-9, '_' (underscore), '-' (hyphen), '/' (forward slash), and '.' (period).

We recommend that you specify this field to prevent confusion. If you omit this field, the file path up to the final dot is used as the log group name. For example, if the file path is `/tmp/TestLogFile.log.2017-07-11-14`, the log group name is `/tmp/TestLogFile.log`.

- **log_stream_name** – Optional. Specifies what to use as the log stream name in CloudWatch Logs. As part of the name, you can use `{instance_id}`, `{hostname}`, `{local_hostname}`, and `{ip_address}` as variables within the name. `{hostname}` retrieves the hostname from the EC2 metadata, while `{local_hostname}` uses the hostname from the network configuration file.

If you omit this field, the default of `{instance_id}` is used. A log stream is created automatically if it does not already exist.

- **timestamp_format** – Optional. Specifies the time stamp format, using plain text and special symbols that start with `%`. If you omit this field, the current time is used. If you use this field, you can use the following as part of the format:

%y

Year without century as a zero-padded decimal number

%Y

Year with century as a decimal number

%b

Month as the locale's abbreviated name

%B

Month as the locale's full name

%m

Month as a zero-padded decimal number

%-m

Month as a decimal number (not zero-padded)

%d

Day of the month as a zero-padded decimal number

%-d

Day of the month as a decimal number (not zero-padded)

%A

Full name of weekday, such as Monday

%a

Abbreviation of weekday, such as Mon

%H

Hour (in a 24-hour clock) as a zero-padded decimal number

%I

Hour (in a 12-hour clock) as a zero-padded decimal number

%-I

Hour (in a 12-hour clock) as decimal number (not zero-padded)

%p

AM or PM

%M

Minutes as a zero-padded decimal number

%-M

Minutes as a decimal number (not zero-padded)

%S

Seconds as a zero-padded decimal number

%-S

Seconds as a decimal number (not zero padded)

%Z

Time zone, for example PST

%z

Time zone, expressed as the offset between the local time zone and UTC. For example, -0700.

- **multi_line_start_pattern** – Specifies the pattern for identifying the start of a log message. A log message is made of a line that matches the pattern and any following lines that don't match the pattern.

If you omit this field, multi-line mode is disabled, and any line that begins with a non-whitespace character closes the previous log message and starts a new log message.

If you include this field, you can specify `{timestamp_format}` to use the same regular expression as your time stamp format. Otherwise, you can specify a different regular expression for CloudWatch Logs to use to determine the start lines of multi-line entries.

- **encoding** – Specified the encoding of the log file so that it can be read correctly. If you specify an incorrect coding, there might be data loss because characters than cannot be decoded are replaced with other characters.

The default is utf-8. Below are all possible values:

ascii, big5, euc-jp, euc-kr, gbk, gb18030, ibm866, iso2022-jp, iso8859-2, iso8859-3, iso8859-4, iso8859-5, iso8859-6, iso8859-7, iso8859-8, iso8859-8-i, iso8859-10, iso8859-13, iso8859-14, iso8859-15, iso8859-16, koi8-r, koi8-u, macintosh, shift_jis, utf-8, utf-16, windows-874, windows-1250, windows-1251, windows-1252, windows-1253, windows-1254, windows-1255, windows-1256, windows-1257, windows-1258, x-mac-cyrillic

- The **windows_events** section specifies the type of Windows events to collect from servers running Windows Server. It includes the following fields:
 - **collect_list** – Required if **windows_events** is included. Specifies the types and levels of Windows events to be collected. Each log to be collected has an entry in this section, which can include the following fields:
 - **event_name** – Specifies the type of Windows events to log. Possible values include System, Security, Application, Setup, and Forwarded Events. This field is required for each type of Windows event to log.
 - **event_levels** – Specifies the levels of event to log. You must specify each level to log. Possible values include INFORMATION, WARNING, ERROR, and SUCCESS. This field is required for each type of Windows event to log.
 - **log_group_name** – Required. Specifies what to use as the log group name in CloudWatch Logs.
 - **log_stream_name** – Optional. Specifies what to use as the log stream name in CloudWatch Logs. As part of the name, you can use `{instance_id}`, `{hostname}`, `{local_hostname}`, and `{ip_address}` as variables within the name. `{hostname}` retrieves the hostname from the EC2 metadata, while `{local_hostname}` uses the hostname from the network configuration file.

If you omit this field, the default of `{instance_id}` is used. A log stream is created automatically if it does not already exist.

- **log_stream_name** – Required. Specifies the default log stream name to be used for any logs or Windows events that do not have individual log stream names defined in their entry in **collect_list**.

The following is an example of a logs section:

```
"logs":{
  "logs_collected":{
    "files":{
      "collect_list":[
        {
          "file_path":"c:\\ProgramData\\Amazon\\AmazonCloudWatchAgent\\Logs\\amazon-
cloudwatch-agent.log",
          "log_group_name":"amazon-cloudwatch-agent.log",
          "log_stream_name":"my_log_stream_name_1",
          "timestamp_format":"%H:%M:%S %y %b %-d"
        },
        {
          "file_path":"c:\\ProgramData\\Amazon\\AmazonCloudWatchAgent\\Logs\\
\\test.log",
          "log_group_name":"test.log",
          "log_stream_name":"my_log_stream_name_2"
        }
      ]
    },
    "windows_events":{
      "collect_list":[
        {
          "event_name":"System",
          "event_levels":[
            "INFORMATION",
            "SUCCESS"
          ],
          "log_group_name":"System",
          "log_stream_name":"System"
        },
        {
          "event_name":"Application",
          "event_levels":[
            "INFORMATION",
            "SUCCESS"
          ],
          "log_group_name":"Application",
          "log_stream_name":"Application"
        }
      ]
    }
  },
  "log_stream_name":"my_log_stream_name"
}
```

CloudWatch Agent Configuration File: Complete Examples

The following is an example of a complete agent configuration file for a Linux server.

```
{
  "agent": {
    "metrics_collection_interval": 10,
    "logfile": "/opt/aws/amazon-cloudwatch-agent/logs/amazon-cloudwatch-agent.log"
  },
  "metrics": {
    "metrics_collected": {
      "cpu": {
```

```
"resources": [
  "*"
],
"measurement": [
  {"name": "cpu_usage_idle", "rename": "CPU_USAGE_IDLE", "unit": "Percent"},
  {"name": "cpu_usage_nice", "unit": "Percent"},
  "cpu_usage_guest"
],
"totalcpu": false,
"metrics_collection_interval": 10,
"append_dimensions": {
  "customized_dimension_key_1": "customized_dimension_value_1",
  "customized_dimension_key_2": "customized_dimension_value_2"
}
},
"disk": {
  "resources": [
    "/",
    "/tmp"
  ],
  "measurement": [
    {"name": "free", "rename": "DISK_FREE", "unit": "Gigabytes"},
    "total",
    "used"
  ],
  "metrics_collection_interval": 60,
  "append_dimensions": {
    "customized_dimension_key_3": "customized_dimension_value_3",
    "customized_dimension_key_4": "customized_dimension_value_4"
  }
},
"diskio": {

  "log_stream_name": "example_log_stream_name"
}
```

Upload the CloudWatch Agent Configuration File to Systems Manager Parameter Store

If you are installing the CloudWatch agent on an Amazon EC2 instance or on an on-premises server that has the SSM Agent installed, then after you manually edit the CloudWatch agent configuration file you must upload it to Systems Manager Parameter Store. To do so, you use the Systems Manager `put-parameter` command.

To be able to store the file in Parameter Store, you must use an IAM role with sufficient permissions. For more information, see [Create IAM Roles and Users for Use With CloudWatch Agent \(p. 46\)](#).

Use the following command, where `parameter name` is the name to be used for this file in Parameter Store, and `configuration_file_pathname` is the path and filename of the configuration file you have edited.

```
aws ssm put-parameter --name "parameter name" --type "String" --value  
file://configuration_file_pathname
```

Common Scenarios with CloudWatch Agent

The following sections outline how to complete some common configuration and customization tasks when using the CloudWatch agent.

Topics

- [Adding Custom Dimensions to Metrics Collected by the CloudWatch Agent \(p. 90\)](#)
- [Aggregating or Rolling Up Metrics Collected by the CloudWatch Agent \(p. 91\)](#)
- [Collecting High-Resolution Metrics With the CloudWatch agent \(p. 91\)](#)

Adding Custom Dimensions to Metrics Collected by the CloudWatch Agent

To add custom dimensions such as tags to metrics collected by the agent, add the `append_dimensions` field to the section of the agent configuration file that lists those metrics.

For example, the following example section of the configuration file adds a custom dimension named `stackName` with a value of `Prod` to the `cpu` and `disk` metrics collected by the agent.

```
"cpu":{  
  "resources":[  
    "*"   
  ],  
  "measurement":[  
    "cpu_usage_guest",  
    "cpu_usage_nice",  
    "cpu_usage_idle"  
  ],  
  "totalcpu":false,  
  "append_dimensions":{  
    "stackName":"Prod"  
  }  
},  
"disk":{  
  "resources":[  
    "/",  
    "/tmp"  
  ],  
  "measurement":[  
    "total",  
    "used"  
  ],  
  "append_dimensions":{  
    "stackName":"Prod"  
  }  
}
```

Remember that any time you change the agent configuration file, you must then restart the agent to have the changes take effect.

Aggregating or Rolling Up Metrics Collected by the CloudWatch Agent

To aggregate or "roll up" metrics collected by the agent, add an `aggregation_dimensions` field to the section for that metric in the agent configuration file.

For example, the following configuration file snippet rolls up metrics on the `AutoScalingGroupName` dimension. The metrics from all instances in each Auto Scaling group are aggregated and can be viewed as a whole.

```
"metrics": {
  "cpu":{...}
  "disk":{...}
  "aggregation_dimensions" : [ "AutoScalingGroupName" ]
}
```

To roll up along the combination of each `InstanceId` and `InstanceType` dimensions in addition to rolling up on the Auto Scaling group name, add the following:

```
"metrics": {
  "cpu":{...}
  "disk":{...}
  "aggregation_dimensions" : [ "AutoScalingGroupName", "InstanceId", "InstanceType" ]
}
```

To roll up metrics into one collection instead, use `[]`.

```
"metrics": {
  "cpu":{...}
  "disk":{...}
  "aggregation_dimensions" : [ [] ]
}
```

Remember that any time you change the agent configuration file, you must then restart the agent to have the changes take effect.

Collecting High-Resolution Metrics With the CloudWatch agent

The `metrics_collection_interval` field specifies the time interval for the metrics collected, in seconds. By specifying a value of less than 60 for this field, the metrics are collected as high-resolution metrics.

For example, if your metrics should all be high resolution and collected every 10 seconds, specify 10 as the value for `metrics_collection_interval` under the `agent` section as a global metrics collection interval:

```
"agent": {
  "metrics_collection_interval": 10
}
```

Alternatively, the following example sets the cpu metrics to be collected every second, while all other metrics are collected every minute.

```
"agent":{
  "metrics_collection_interval": 60
},
"metrics":{
  "metrics_collected":{
    "cpu":{
      "resources":[
        "*"
      ],
      "measurement":[
        "cpu_usage_guest"
      ],
      "totalcpu":false,
      "metrics_collection_interval": 1
    },
    "disk":{
      "resources":[
        "/",
        "/tmp"
      ],
      "measurement":[
        "total",
        "used"
      ]
    }
  }
}
```

Remember that any time you change the agent configuration file, you must then restart the agent to have the changes take effect.

Troubleshooting the CloudWatch Agent

Use the following information to help troubleshoot problems with the CloudWatch agent.

Topics

- [Installing the CloudWatch Agent Using Run Command Fails \(p. 92\)](#)
- [The CloudWatch Agent Won't Start \(p. 93\)](#)
- [Verify That the CloudWatch Agent is Running \(p. 93\)](#)
- [Where Are the Metrics? \(p. 94\)](#)
- [CloudWatch Agent Files and Locations \(p. 94\)](#)
- [Logs Generated by the CloudWatch Agent \(p. 95\)](#)
- [Stopping and Restarting the CloudWatch Agent \(p. 95\)](#)
- [Starting the CloudWatch Agent at System Startup \(p. 96\)](#)

Installing the CloudWatch Agent Using Run Command Fails

To install the CloudWatch agent using Systems Manager Run Command, the SSM Agent on the target server must be version 2.2.93.0 or later. If your SSM Agent is not the correct version, you may see errors that include the following messages:

```
no latest version found for package AmazonCloudWatchAgent on platform linux
```

```
failed to download installation package reliably
```

For information about updating your SSM Agent version, see [Installing and Configuring SSM Agent](#).

The CloudWatch Agent Won't Start

If the CloudWatch agent fails to start, there might be an issue in your configuration. Configuration information is logged in the **configuration-validation.log** file. This file is located in `/opt/aws/amazon-cloudwatch-agent/logs/configuration-validation.log` on Linux servers, and in `$Env:ProgramData\Amazon\AmazonCloudWatchAgent\Logs\configuration-validation.log` on servers running Windows Server.

Verify That the CloudWatch Agent is Running

You can query the CloudWatch agent to find whether it is running or stopped.

You can use AWS Systems Manager to do this remotely. You can also use the command line, but only to check the local server.

To query the status of the CloudWatch agent using Run Command

1. Open the Systems Manager console at <https://console.aws.amazon.com/systems-manager/>.
2. In the navigation pane, choose **Run Command**.

-or-

If the AWS Systems Manager home page opens, scroll down and choose **Explore Run Command**.

3. Choose **Run command**.
4. In the **Command document** list, choose **AmazonCloudWatch-ManageAgent**.
5. In the **Target** area, choose the instance to check.
6. In the **Action** list, choose **status**.
7. Leave **Optional Configuration Source** and **Optional Configuration Location** blank.
8. Choose **Run**.

If the agent is running, the output resembles the following:

```
{
  "status": "running",
  "starttime": "2017-12-12T18:41:18",
  "version": "1.73.4"
}
```

If the agent is stopped the "status" field displays "stopped".

To query the status of the CloudWatch agent locally using the command line

- On a Linux server, type the following:

```
sudo /opt/aws/amazon-cloudwatch-agent/bin/amazon-cloudwatch-agent-ctl -m ec2 -a status
```

On a server running Windows Server, type the following in PowerShell as an administrator:

```
& $Env:ProgramFiles\Amazon\AmazonCloudWatchAgent\amazon-cloudwatch-agent-ctl.ps1 -m ec2  
-a status
```

Where Are the Metrics?

If the CloudWatch agent has been running but you cannot find metrics collected by it in the AWS Management Console or the AWS CLI, confirm that you are using the correct namespace. By default the namespace for metrics collected by the agent is `CWAgent`. You can customize this namespace using the **namespace** field in the **metrics** section of the agent configuration file. If you do not see the metrics that you expect, check the configuration file to confirm the namespace being used.

When you first download the CloudWatch agent package, the agent configuration file is `amazon-cloudwatch-agent.json`. This file is located in the directory where you ran the configuration wizard, or you may have moved it to a different directory. If you use the configuration wizard, the agent configuration file output from the wizard is named `config.json`. For more information about the configuration file, including the **namespace** field, see [CloudWatch Agent Configuration File: Metrics Section \(p. 75\)](#).

CloudWatch Agent Files and Locations

The following table lists the files installed by and used with the CloudWatch agent, along with their locations on servers running Linux or Windows Server.

File	Linux Location	Windows Server Location
The control script that controls starting, stopping, and restarting the agent.	<code>/opt/aws/amazon-cloudwatch-agent/bin/amazon-cloudwatch-agent-ctl</code>	<code>\$Env:ProgramFiles\Amazon\AmazonCloudWatchAgent\amazon-cloudwatch-agent-ctl.ps1</code>
The log file the agent writes to. You may need to attach this when contacting customer support.	<code>/opt/aws/amazon-cloudwatch-agent/logs/amazon-cloudwatch-agent.log</code>	<code>\$Env:ProgramData\Amazon\AmazonCloudWatchAgent\Logs\amazon-cloudwatch-agent.log</code>
Agent configuration validation file.	<code>/opt/aws/amazon-cloudwatch-agent/logs/configuration-validation.log</code>	<code>\$Env:ProgramData\Amazon\AmazonCloudWatchAgent\Logs\configuration-validation.log</code>
The JSON file used to configure the agent, immediately after the wizard creates it. For more information, see Create the CloudWatch Agent Configuration File (p. 69) .	<code>/opt/aws/amazon-cloudwatch-agent/etc/config.json</code>	<code>\$Env:ProgramData\Amazon\AmazonCloudWatchAgent\config.json</code>
The JSON file used to configure the agent, if this configuration file has been downloaded from Parameter Store.	<code>/opt/aws/amazon-cloudwatch-agent/etc/amazon-cloudwatch-agent.json</code>	<code>\$Env:ProgramData\Amazon\AmazonCloudWatchAgent\amazon-cloudwatch-agent.json</code>

File	Linux Location	Windows Server Location
TOML file used to specify region and credential information to be used by the agent, overriding system defaults.	/opt/aws/amazon-cloudwatch-agent/etc/common-config.toml	\$Env:ProgramData\Amazon\AmazonCloudWatchAgent\common-config.toml
TOML file generated from the JSON configuration file when the CloudWatch agent is started.	/opt/aws/amazon-cloudwatch-agent/etc/amazon-cloudwatch-agent.toml	\$Env:ProgramData\Amazon\AmazonCloudWatchAgent\amazon-cloudwatch-agent.toml

Logs Generated by the CloudWatch Agent

The agent generates a log while it runs. This log includes troubleshooting information. This log is the **amazon-cloudwatch-agent.log** file. This file is located in `/opt/aws/amazon-cloudwatch-agent/logs/amazon-cloudwatch-agent.log` on Linux servers, and in `$Env:ProgramData\Amazon\AmazonCloudWatchAgent\Logs\amazon-cloudwatch-agent.log` on servers running Windows Server.

You can configure the agent to log additional details in the **amazon-cloudwatch-agent.log** file. In the agent configuration file, in the **agent** section, set the **debug** field to **true**, then reconfigure and restart the CloudWatch agent. To disable the logging of this extra information, set the **debug** field to **false** reconfigure and restart the agent. For more information, see [Manually Create or Edit the CloudWatch Agent Configuration File](#) (p. 74).

Stopping and Restarting the CloudWatch Agent

You can manually stop the CloudWatch agent using either AWS Systems Manager or the command line. When you stop it manually, you also prevent it from automatically starting at system reboot.

To stop the CloudWatch agent using Run Command

1. Open the Systems Manager console at <https://console.aws.amazon.com/systems-manager/>.
2. In the navigation pane, choose **Run Command**.

-or-

If the AWS Systems Manager home page opens, scroll down and choose **Explore Run Command**.

3. Choose **Run command**.
4. In the **Command document** list, choose **AmazonCloudWatch-ManageAgent**.
5. In the **Targets** area, choose the instance where you installed the CloudWatch agent.
6. In the **Action** list, choose **stop**.
7. Leave **Optional Configuration Source** and **Optional Configuration Location** blank.
8. Choose **Run**.

To stop the CloudWatch agent locally using the command line

- On a Linux server, type the following:

```
sudo /opt/aws/amazon-cloudwatch-agent/bin/amazon-cloudwatch-agent-ctl -m ec2 -a stop
```

On a server running Windows Server, type the following in PowerShell as an administrator:

```
& $Env:ProgramFiles\Amazon\AmazonCloudWatchAgent\amazon-cloudwatch-agent-ctl.ps1 -m ec2  
-a stop
```

To restart the agent, follow the instructions in [Start the CloudWatch Agent \(p. 53\)](#).

Starting the CloudWatch Agent at System Startup

On both Linux and Windows Server, the CloudWatch agent installation scripts register the agent as a system service. This service is configured to start when your instance or server boots, if the agent was running before the reboot occurred. The CloudWatch agent relies on having been previously configured for it to properly start. If you are preparing an AMI or machine image that starts the CloudWatch agent on newly launched Amazon EC2 instances or on-premises servers, including instances launched by Auto Scaling and Spot Fleet, ensure that the `amazon-cloudwatch-agent.toml` and `common-config.toml` files are included in your AMI. These files are located in `/opt/aws/amazon-cloudwatch-agent/etc/` on Linux servers, and in `$Env:ProgramData\Amazon\AmazonCloudWatchAgent\` on servers running Windows Server.

If your instance starts and these files are not present, the CloudWatch agent does not start correctly.

Amazon CloudWatch Metrics and Dimensions Reference

This reference includes all the namespaces, dimensions, and metrics that you can use with CloudWatch. Namespaces are containers for metrics. Metrics, which are time-ordered sets of data points, are isolated from one another in different namespaces so that metrics from different applications are not mistakenly aggregated into the same statistics. In addition, each metric has a dimension, which is a name/value pair that you can use to filter metrics.

AWS Namespaces

CloudWatch namespaces are containers for metrics. Metrics in different namespaces are isolated from each other, so that metrics from different applications are not mistakenly aggregated into the same statistics. All AWS services that provide Amazon CloudWatch data use a namespace string, beginning with "AWS/". When you create custom metrics, you must also specify a namespace as a container for custom metrics. Namespaces for custom metrics cannot start with "AWS/". The following services push metric data points to CloudWatch.

AWS Product	Namespace
Amazon API Gateway	AWS/ApiGateway
AppStream 2.0	AWS/AppStream
Amazon EC2 Auto Scaling	AWS/AutoScaling
AWS Billing	AWS/Billing
Amazon CloudFront	AWS/CloudFront
Amazon CloudSearch	AWS/CloudSearch
Amazon CloudWatch Events	AWS/Events
Amazon CloudWatch Logs	AWS/Logs
Amazon Connect	AWS/Connect

AWS Product	Namespace
AWS Database Migration Service	AWS/DMS
AWS Direct Connect	AWS/DX
Amazon DynamoDB	AWS/DynamoDB
Amazon EC2	AWS/EC2
Amazon EC2	AWS/EC2Spot (Spot Instances)
Amazon Elastic Container Service	AWS/ECS
AWS Elastic Beanstalk	AWS/ElasticBeanstalk
Amazon Elastic Block Store	AWS/EBS
Amazon Elastic File System	AWS/EFS
Elastic Load Balancing	AWS/ELB (Classic Load Balancers)
Elastic Load Balancing	AWS/ApplicationELB (Application Load Balancers)
Elastic Load Balancing	AWS/NetworkELB (Network Load Balancers)
Amazon Elastic Transcoder	AWS/ElasticTranscoder
Amazon ElastiCache	AWS/ElastiCache
Amazon Elasticsearch Service	AWS/ES
Amazon EMR	AWS/ElasticMapReduce
Amazon GameLift	AWS/GameLift
Amazon Inspector	AWS/Inspector
AWS IoT	AWS/IoT
AWS Key Management Service	AWS/KMS
Amazon Kinesis Data Analytics	AWS/KinesisAnalytics
Amazon Kinesis Data Firehose	AWS/Firehose
Amazon Kinesis Data Streams	AWS/Kinesis
Amazon Kinesis Video Streams	AWS/KinesisVideo
AWS Lambda	AWS/Lambda
Amazon Lex	AWS/Lex
Amazon Machine Learning	AWS/ML
AWS OpsWorks	AWS/OpsWorks
Amazon Polly	AWS/Polly
Amazon Redshift	AWS/Redshift

AWS Product	Namespace
Amazon Relational Database Service	AWS/RDS
Amazon Route 53	AWS/Route53
Amazon SageMaker	AWS/SageMaker
AWS Shield Advanced	AWS/DDoSProtection
Amazon Simple Email Service	AWS/SES
Amazon Simple Notification Service	AWS/SNS
Amazon Simple Queue Service	AWS/SQS
Amazon Simple Storage Service	AWS/S3
Amazon Simple Workflow Service	AWS/SWF
AWS Step Functions	AWS/States
AWS Storage Gateway	AWS/StorageGateway
Amazon VPC	AWS/NATGateway (NAT gateway)
Amazon VPC	AWS/VPN (VPN)
AWS WAF	WAF
Amazon WorkSpaces	AWS/WorkSpaces

Amazon API Gateway Metrics and Dimensions

The metrics and dimensions that API Gateway sends to Amazon CloudWatch are listed below. For more information, see [Monitor API Execution with Amazon CloudWatch](#) in the *Amazon API Gateway Developer Guide*.

API Gateway Metrics

Amazon API Gateway sends metric data to CloudWatch every minute.

The `AWS/ApiGateway` namespace includes the following metrics.

Metric	Description
4XXError	<p>The number of client-side errors captured in a specified period.</p> <p>The <code>Sum</code> statistic represents this metric, namely, the total count of the 4XXError errors in the given period. The <code>Average</code> statistic represents the 4XXError error rate, namely, the total count of the 4XXError errors divided by the total number of requests during the period. The denominator corresponds to the <code>Count</code> metric (below).</p> <p>Unit: Count</p>

Metric	Description
5XXError	<p>The number of server-side errors captured in a given period.</p> <p>The <code>Sum</code> statistic represents this metric, namely, the total count of the 5XXError errors in the given period. The <code>Average</code> statistic represents the 5XXError error rate, namely, the total count of the 5XXError errors divided by the total number of requests during the period. The denominator corresponds to the <code>Count</code> metric (below).</p> <p>Unit: Count</p>
CacheHitCount	<p>The number of requests served from the API cache in a given period.</p> <p>The <code>Sum</code> statistic represents this metric, namely, the total count of the cache hits in the specified period. The <code>Average</code> statistic represents the cache hit rate, namely, the total count of the cache hits divided by the total number of requests during the period. The denominator corresponds to the <code>Count</code> metric (below).</p> <p>Unit: Count</p>
CacheMissCount	<p>The number of requests served from the back end in a given period, when API caching is enabled.</p> <p>The <code>Sum</code> statistic represents this metric, namely, the total count of the cache misses in the specified period. The <code>Average</code> statistic represents the cache miss rate, namely, the total count of the cache hits divided by the total number of requests during the period. The denominator corresponds to the <code>Count</code> metric (below).</p> <p>Unit: Count</p>
Count	<p>The total number API requests in a given period.</p> <p>The <code>SampleCount</code> statistic represents this metric.</p> <p>Unit: Count</p>
IntegrationLatency	<p>The time between when API Gateway relays a request to the back end and when it receives a response from the back end.</p> <p>Unit: Millisecond</p>
Latency	<p>The time between when API Gateway receives a request from a client and when it returns a response to the client. The latency includes the integration latency and other API Gateway overhead.</p> <p>Unit: Millisecond</p>

Dimensions for Metrics

You can use the dimensions in the following table to filter API Gateway metrics.

Dimension	Description
ApiName	Filters API Gateway metrics for an API of the specified API name.
ApiName, Method, Resource, Stage	<p>Filters API Gateway metrics for an API method of the specified API, stage, resource, and method.</p> <p>API Gateway will not send such metrics unless you have explicitly enabled detailed CloudWatch metrics. You can do this in the console by selecting Enable CloudWatch Metrics under a stage Settings tab. Alternatively, you can call the stage:update action of the API Gateway REST API to update the <code>metricsEnabled</code> property to <code>true</code>.</p> <p>Enabling such metrics will incur additional charges to your account. For pricing information, see Amazon CloudWatch Pricing.</p>
ApiName, Stage	Filters API Gateway metrics for an API stage of the specified API and stage.

AppStream 2.0 Metrics and Dimensions

The metrics and dimensions that AppStream 2.0 sends to Amazon CloudWatch are listed below. For more information, see [Monitor Amazon AppStream 2.0 With Amazon CloudWatch](#) in the *Amazon AppStream 2.0 Developer Guide*.

Amazon AppStream 2.0 Metrics

AppStream 2.0 sends metrics to CloudWatch one time every minute. The `AWS/AppStream` namespace includes the following metrics.

Metric	Description
ActualCapacity	<p>The total number of instances that are available for streaming or are currently streaming.</p> <div>ActualCapacity = AvailableCapacity + InUseCapacity</div> <p>Units: Count</p> <p>Valid statistics: Average, Minimum, Maximum</p>
AvailableCapacity	<p>The number of idle instances currently available for user sessions.</p> <div>AvailableCapacity = ActualCapacity - InUseCapacity</div>

Metric	Description
	<p>Units: Count</p> <p>Valid statistics: Average, Minimum, Maximum</p>
CapacityUtilization	<p>The percentage of instances in a fleet that are being used, using the following formula.</p> $\text{CapacityUtilization} = (\text{InUseCapacity} / \text{ActualCapacity}) * 100$ <p>Monitoring this metric helps with decisions about increasing or decreasing the value of a fleet's desired capacity.</p> <p>Units: Percent</p> <p>Valid statistics: Average, Minimum, Maximum</p>
DesiredCapacity	<p>The total number of instances that are either running or pending. This represents the total number of concurrent streaming sessions your fleet can support in a steady state.</p> $\text{DesiredCapacity} = \text{ActualCapacity} + \text{PendingCapacity}$ <p>Units: Count</p> <p>Valid statistics: Average, Minimum, Maximum</p>
InUseCapacity	<p>The number of instances currently being used for streaming sessions. One InUseCapacity count represents one streaming session.</p> <p>Units: Count</p> <p>Valid statistics: Average, Minimum, Maximum</p>
PendingCapacity	<p>The number of instances being provisioned by AppStream 2.0. Represents the additional number of streaming sessions the fleet can support after provisioning is complete. When provisioning starts, it usually takes 10-20 minutes for an instance to become available for streaming.</p> <p>Units: Count</p> <p>Valid statistics: Average, Minimum, Maximum</p>
RunningCapacity	<p>The total number of instances currently running. Represents the number of concurrent streaming sessions that can be supported by the fleet in its current state.</p> <p>This metric is provided for Always-On fleets only, and has the same value as the ActualCapacity metric.</p> <p>Units: Count</p> <p>Valid statistics: Average, Minimum, Maximum</p>

Metric	Description
InsufficientCapacity	<p>The number of session requests rejected due to lack of capacity.</p> <p>You can set alarms to use this metric to be notified of users waiting for streaming sessions.</p> <p>Units: Count</p> <p>Valid statistics: Average, Minimum, Maximum, Sum</p>

Dimensions for Amazon AppStream 2.0 Metrics

To filter the metrics provided by Amazon AppStream 2.0, use the following dimension.

Dimension	Description
Fleet	The name of the fleet.

Auto Scaling Metrics and Dimensions

Auto Scaling sends metrics for instances and groups to CloudWatch. For Auto Scaling instances, you can enable detailed (one-minute) monitoring or basic (five-minute) monitoring. For Auto Scaling groups, you can enable group metrics. For more information, see [Monitoring Your Auto Scaling Instances and Groups](#) in the *Amazon EC2 Auto Scaling User Guide*.

Auto Scaling Group Metrics

If you enable group metrics, Auto Scaling sends aggregated data to CloudWatch every minute.

The AWS/AutoScaling namespace includes the following metrics.

Metric	Description
GroupMinSize	The minimum size of the Auto Scaling group.
GroupMaxSize	The maximum size of the Auto Scaling group.
GroupDesiredCapacity	The number of instances that the Auto Scaling group attempts to maintain.
GroupInServiceInstances	The number of instances that are running as part of the Auto Scaling group. This metric does not include instances that are pending or terminating.
GroupPendingInstances	The number of instances that are pending. A pending instance is not yet in service. This metric does not include instances that are in service or terminating.
GroupStandbyInstances	The number of instances that are in a Standby state. Instances in this state are still running but are not actively in service.

Metric	Description
GroupTerminatingInstances	The number of instances that are in the process of terminating. This metric does not include instances that are in service or pending.
GroupTotalInstances	The total number of instances in the Auto Scaling group. This metric identifies the number of instances that are in service, pending, and terminating.

Dimensions for Auto Scaling Group Metrics

To filter the metrics for your Auto Scaling group by group name, use the `AutoScalingGroupName` dimension.

AWS Billing and Cost Management Dimensions and Metrics

The AWS Billing and Cost Management service sends metrics to CloudWatch. For more information, see [Monitoring Charges with Alerts and Notifications](#) in the *AWS Billing and Cost Management User Guide*.

AWS Billing and Cost Management Metrics

The `AWS/Billing` namespace includes the following metrics.

Metric	Description
EstimatedCharges	The estimated charges for your AWS usage. This can either be estimated charges for one service or a roll-up of estimated charges for all services.

Dimensions for AWS Billing and Cost Management Metrics

Billing and Cost Management supports filtering metrics by the following dimensions.

Dimension	Description
ServiceName	The name of the AWS service. This dimension is omitted for the total of estimated charges across all services.
LinkedAccount	The linked account number. This is used for consolidated billing only. This dimension is included only for accounts that are linked to a separate paying account in a consolidated billing relationship. It is not included for accounts that are not linked to a consolidated billing paying account.

Dimension	Description
Currency	The monetary currency to bill the account. This dimension is required. Unit: USD

Amazon CloudFront Metrics and Dimensions

Amazon CloudFront sends metrics to Amazon CloudWatch for web distributions. Metrics and dimensions are not available for RTMP distributions. For more information, see [Monitoring CloudFront Activity Using CloudWatch](#) in the *Amazon CloudFront Developer Guide*.

Amazon CloudFront Metrics

The `AWS/CloudFront` namespace includes the following metrics.

Note

Only one statistic, Average or Sum, is applicable for each metric. However, all statistics are available through the console, API, and AWS Command Line Interface. In the following table, each metric specifies the statistic that is applicable to that metric.

Metric	Description
Requests	The number of requests for all HTTP methods and for both HTTP and HTTPS requests. Valid Statistics: Sum Units: None
BytesDownloaded	The number of bytes downloaded by viewers for <code>GET</code> , <code>HEAD</code> , and <code>OPTIONS</code> requests. Valid Statistics: Sum Units: None
BytesUploaded	The number of bytes uploaded to your origin with CloudFront using <code>POST</code> and <code>PUT</code> requests. Valid Statistics: Sum Units: None
TotalErrorRate	The percentage of all requests for which the HTTP status code is 4xx or 5xx. Valid Statistics: Average Units: Percent
4xxErrorRate	The percentage of all requests for which the HTTP status code is 4xx. Valid Statistics: Average

Metric	Description
	Units: Percent
5xxErrorRate	The percentage of all requests for which the HTTP status code is 5xx. Valid Statistics: Average Units: Percent

Dimensions for CloudFront Metrics

CloudFront metrics use the CloudFront namespace and provide metrics for two dimensions:

Dimension	Description
DistributionId	The CloudFront ID of the distribution for which you want to display metrics.
Region	The region for which you want to display metrics. This value must be <code>Global</code> . The <code>Region</code> dimension is different from the region in which CloudFront metrics are stored, which is US East (N. Virginia).

Amazon CloudSearch Metrics and Dimensions

Amazon CloudSearch sends metrics to Amazon CloudWatch. For more information, see [Monitoring an Amazon CloudSearch Domain with Amazon CloudWatch](#) in the *Amazon CloudSearch Developer Guide*.

Amazon CloudSearch Metrics

The `AWS/CloudSearch` namespace includes the following metrics.

Metric	Description
SuccessfulRequests	The number of search requests successfully processed by a search instance. Units: Count Valid statistics: Maximum, Sum
SearchableDocuments	The number of searchable documents in the domain's search index. Units: Count Valid statistics: Maximum
IndexUtilization	The percentage of the search instance's index capacity that has been used. The Maximum value indicates the percentage of the domain's index capacity that has been used. Units: Percent

Metric	Description
	Valid statistics: Average, Maximum
Partitions	The number of partitions the index is distributed across. Units: Count Valid statistics: Minimum, Maximum

Dimensions for Amazon CloudSearch Metrics

Amazon CloudSearch sends the ClientId and DomainName dimensions to CloudWatch.

Dimension	Description
ClientId	The AWS account ID.
DomainName	The name of the search domain.

Metrics Collected by the CloudWatch Agent

You can collect metrics from servers by installing the CloudWatch agent on the server. You can install the agent on both Amazon EC2 instances and on-premises servers, and on servers running either Linux or Windows Server. If you install the agent on an Amazon EC2 instance, the metrics it collects are in addition to the metrics enabled by default on Amazon EC2 instances, which are listed in [Amazon EC2 Metrics and Dimensions \(p. 133\)](#).

For information about installing the CloudWatch agent on an instance, see [Collect Metrics and Logs from Amazon EC2 Instances and On-Premises Servers with the CloudWatch Agent \(p. 45\)](#).

Metrics Collected by the CloudWatch Agent on Windows Server Instances

On a server running Windows Server, installing the CloudWatch agent enables you to collect the metrics associated with the counters in Windows Performance Monitor. The CloudWatch metric names for these counters are created by putting a space between the object name and the counter name. For example, the % Interrupt Time counter of the Processor object is given the metric name `Processor % Interrupt Time` in CloudWatch. For more information about Windows Performance Monitor counters, see the Microsoft Windows Server documentation.

The default namespace for metrics collected by the CloudWatch agent is `CWAgent`, although you can specify a different namespace when you configure the agent.

Metrics Collected by the CloudWatch Agent on Linux Instances

The metrics that you can collect with the CloudWatch agent on Linux instances are listed in the following table.

Metric	Description
cpu_time_active	<p>The amount of time that the CPU is active in any capacity. This metric is measured in hundredths of a second.</p> <p>Unit: None</p>
cpu_time_guest	<p>The amount of time that the CPU is running a virtual CPU for a guest operating system. This metric is measured in hundredths of a second.</p> <p>Unit: None</p>
cpu_time_guest_nice	<p>The amount of time that the CPU is running a virtual CPU for a guest operating system which is low-priority and can be interrupted by other processes. This metric is measured in hundredths of a second.</p> <p>Unit: None</p>
cpu_time_idle	<p>The amount of time that the CPU is idle. This metric is measured in hundredths of a second.</p> <p>Unit: None</p>
cpu_time_iowait	<p>The amount of time that the CPU is waiting for I/O operations to complete. This metric is measured in hundredths of a second.</p> <p>Unit: None</p>
cpu_time_irq	<p>The amount of time that the CPU is servicing interrupts. This metric is measured in hundredths of a second.</p> <p>Unit: None</p>
cpu_time_nice	<p>The amount of time that the CPU is in user mode with low-priority processes which can easily be interrupted by higher-priority processes. This metric is measured in hundredths of a second.</p> <p>Unit: None</p>
cpu_time_softirq	<p>The amount of time that the CPU is servicing software interrupts. This metric is measured in hundredths of a second.</p> <p>Unit: None</p>
cpu_time_steal	<p>The amount of time that the CPU is in <i>stolen time</i>, which is time spent in other operating systems in a virtualized environment. This metric is measured in hundredths of a second.</p> <p>Unit: None</p>
cpu_time_system	<p>The amount of time that the CPU is in system mode. This metric is measured in hundredths of a second.</p>

Metric	Description
	Unit: None
cpu_time_user	The amount of time that the CPU is in user mode. This metric is measured in hundredths of a second. Unit: None
cpu_usage_guest	The percentage of time that the CPU is running a virtual CPU for a guest operating system. Unit: Percent
cpu_usage_guest_nice	The percentage of time that the CPU is running a virtual CPU for a guest operating system which is low-priority and can be interrupted by other processes. Unit: Percent
cpu_usage_idle	The percentage of time that the CPU is idle. Unit: Percent
cpu_usage_iowait	The percentage of time that the CPU is waiting for I/O operations to complete. Unit: Percent
cpu_usage_irq	The percentage of time that the CPU is servicing interrupts. Unit: Percent
cpu_usage_nice	The percentage of time that the CPU is in user mode with low-priority processes which can easily be interrupted by higher-priority processes. Unit: Percent
cpu_usage_softirq	The percentage of time that the CPU is servicing software interrupts. Unit: Percent
cpu_usage_steal	The percentage of time that the CPU is in <i>stolen time</i> , which is time spent in other operating systems in a virtualized environment. Unit: Percent
cpu_usage_system	The percentage of time that the CPU is in system mode. Unit: Percent
cpu_usage_user	The percentage of time that the CPU is in user mode. Unit: Percent

Metric	Description
disk_free	Free space on the disks. Unit: Bytes
disk_inodes_free	The number of available index nodes on the disk. Unit: Count
disk_inodes_total	The total number of index nodes reserved on the disk. Unit: Count
disk_inodes_used	The number of used index nodes on the disk. Unit: Count
disk_total	Total space on the disks, including used and free. Unit: Bytes
disk_used	Used space on the disks. Unit: Bytes
disk_used_percent	The percentage of total disk space that is used. Unit: Percent
diskio_iops_in_progress	The number of I/O requests that have been issued to the device driver but have not yet completed. Unit: Count
diskio_io_time	The amount of time that the disk has had I/O requests queued. Unit: Milliseconds
diskio_reads	The number of disk read operations. Unit: Count
diskio_read_bytes	The number of bytes read from the disks. Unit: Bytes
diskio_read_time	The amount of time that read requests have waited on the disks. Multiple read requests waiting at the same time all increase the number. For example, if 5 requests all wait for an average of 100 milliseconds, then 500 is reported. Unit: Milliseconds
diskio_writes	The number disk write operations. Unit: Count

Metric	Description
diskio_write_bytes	The number of bytes written to the disks. Unit: Bytes
diskio_write_time	The amount of time that write requests have waited on the disks. Multiple write requests waiting at the same time all increase the number. For example, if 8 requests all wait for an average of 1000 milliseconds, then 8000 is reported. Unit: Milliseconds
mem_active	The amount of memory that has been used in some way during the last sample period. Unit: Bytes
mem_available	The amount of memory that is available and can be given instantly to processes. Unit: Bytes
mem_available_percent	The percentage of memory that is available and can be given instantly to processes. Unit: Percent
mem_buffered	The amount of memory that is being used for buffers. Unit: Bytes
mem_cached	The amount of memory that is being used for file caches. Unit: Bytes
mem_free	The amount of memory that is not being used. Unit: Bytes
mem_inactive	The amount of memory that has not been used in some way during the last sample period Unit: Bytes
mem_total	The total amount of memory. Unit: Bytes
mem_used	The amount of memory currently in use. Unit: Bytes
mem_used_percent	The percentage of memory currently in use. Unit: Percent

Metric	Description
net_bytes_recv	The number of bytes received by the network interface. Unit: Bytes
net_bytes_sent	The number of bytes sent by the network interface. Unit: Bytes
net_drop_in	The number of packets received by this network interface which were dropped. Unit: Count
net_drop_out	The number of packets transmitted by this network interface which were dropped. Unit: Count
net_err_in	The number of receive errors detected by this network interface. Unit: Count
net_err_out	The number of transmit errors detected by this network interface. Unit: Count
net_packets_sent	The number of packets sent by this network interface. Unit: Count
net_packets_recv	The number of packets received by this network interface. Unit: Count
netstat_tcp_close	The number of TCP connections with no state. Unit: Count
netstat_tcp_close_wait	The number of TCP connections waiting for a termination request from the client. Unit: Count
netstat_tcp_closing	The number of TCP connections that are waiting for a termination request with acknowledgement from the client. Unit: Count
netstat_tcp_established	The number of TCP connections established. Unit: Count

Metric	Description
netstat_tcp_fin_wait1	The number of TCP connections in the FIN_WAIT1 state, during the process of closing a connection. Unit: Count
netstat_tcp_fin_wait2	The number of TCP connections in the FIN_WAIT2 state, during the process of closing a connection. Unit: Count
netstat_tcp_last_ack	The number of TCP connections waiting for the client to send acknowledgement of the connection termination message. This is the last state right before the connection is closed down. Unit: Count
netstat_tcp_listen	The number of TCP ports currently listening for a connection request. Unit: Count
netstat_tcp_none	The number of TCP connections with inactive clients. Unit: Count
netstat_tcp_syn_sent	The number of TCP connections waiting for a matching connection request after having sent a connection request. Unit: Count
netstat_tcp_syn_rcv	The number of TCP connections waiting for connection request acknowledgement after having sent and received a connection request. Unit: Count
netstat_tcp_time_wait	The number of TCP connections currently waiting to ensure the client received the acknowledgement of its connection termination request. Unit: Count
netstat_udp_socket	The number of current UDP connections. Unit: Count
processes_blocked	The number of processes that are blocked. Unit: Count
processes_dead	The number of processes that are "dead," which is indicated by the X state code on Linux. Unit: Count

Metric	Description
processes_idle	The number of processes that are idle (sleeping for more than 20 seconds). Available only on FreeBSD instances. Unit: Count
processes_paging	The number of processes that are paging, which is indicated by the W state code on Linux. Unit: Count
processes_running	The number of processes that are running, indicated by the R state code. Unit: Count
processes_sleeping	The number of processes that are sleeping, indicated by the S state code. Unit: Count
processes_stopped	The number of processes that are stopped, indicated by the T state code. Unit: Count
processes_total	The total number of processes on the instance. Unit: Count
processes_total_threads	The total number of threads making up the processes. This metric is available only on Linux instances. Unit: Count
processes_wait	The number of processes that are paging, which is indicated by the W state code on FreeBSD instances. This metric is available only on FreeBSD instances. Unit: Count
processes_zombie	The number of zombie processes, indicated by the Z state code. Unit: Count
swap_free	The amount of swap space that is not being used. Unit: Bytes
swap_used	The amount of swap space currently in use. Unit: Bytes
swap_used_percent	The percentage of swap space currently in use. Unit: Percent

Amazon CloudWatch Events Metrics and Dimensions

CloudWatch Events sends metrics to Amazon CloudWatch every minute.

CloudWatch Events Metrics

The `AWS/Events` namespace includes the following metrics.

All of these metrics use `Count` as the unit, so `Sum` and `SampleCount` are the most useful statistics.

Metric	Description
<code>Invocations</code>	<p>Measures the number of times a target is invoked for a rule in response to an event. This includes successful and failed invocations, but does not include throttled or retried attempts until they fail permanently.</p> <p>Note CloudWatch Events only sends this metric to CloudWatch if it has a non-zero value.</p> <p>Valid Dimensions: <code>RuleName</code></p> <p>Units: <code>Count</code></p>
<code>FailedInvocations</code>	<p>Measures the number of invocations that failed permanently. This does not include invocations that are retried or that succeeded after a retry attempt.</p> <p>Valid Dimensions: <code>RuleName</code></p> <p>Units: <code>Count</code></p>
<code>TriggeredRules</code>	<p>Measures the number of triggered rules that matched with any event.</p> <p>Valid Dimensions: <code>RuleName</code></p> <p>Units: <code>Count</code></p>
<code>MatchedEvents</code>	<p>Measures the number of events that matched with any rule.</p> <p>Valid Dimensions: <code>None</code></p> <p>Units: <code>Count</code></p>
<code>ThrottledRules</code>	<p>Measures the number of triggered rules that are being throttled.</p> <p>Valid Dimensions: <code>RuleName</code></p> <p>Units: <code>Count</code></p>

Dimensions for CloudWatch Events Metrics

CloudWatch Events metrics have one dimension, which is listed below.

Dimension	Description
RuleName	Filters the available metrics by rule name.

Amazon CloudWatch Logs Metrics and Dimensions

CloudWatch Logs sends metrics to CloudWatch every minute.

CloudWatch Logs Metrics

The `AWS/Logs` namespace includes the following metrics.

Metric	Description
IncomingBytes	<p>The volume of log events in uncompressed bytes uploaded to CloudWatch Logs. When used with the <code>LogGroupName</code> dimension, this is the volume of log events in uncompressed bytes uploaded to the log group.</p> <p>Valid Dimensions: <code>LogGroupName</code></p> <p>Valid Statistic: <code>Sum</code></p> <p>Units: <code>Bytes</code></p>
IncomingLogEvents	<p>The number of log events uploaded to CloudWatch Logs. When used with the <code>LogGroupName</code> dimension, this is the number of log events uploaded to the log group.</p> <p>Valid Dimensions: <code>LogGroupName</code></p> <p>Valid Statistic: <code>Sum</code></p> <p>Units: <code>None</code></p>
ForwardedBytes	<p>The volume of log events in compressed bytes forwarded to the subscription destination.</p> <p>Valid Dimensions: <code>LogGroupName</code>, <code>DestinationType</code>, <code>FilterName</code></p> <p>Valid Statistic: <code>Sum</code></p> <p>Units: <code>Bytes</code></p>
ForwardedLogEvents	<p>The number of log events forwarded to the subscription destination.</p> <p>Valid Dimensions: <code>LogGroupName</code>, <code>DestinationType</code>, <code>FilterName</code></p> <p>Valid Statistic: <code>Sum</code></p> <p>Units: <code>None</code></p>
DeliveryErrors	<p>The number of log events for which CloudWatch Logs received an error when forwarding data to the subscription destination.</p> <p>Valid Dimensions: <code>LogGroupName</code>, <code>DestinationType</code>, <code>FilterName</code></p>

Metric	Description
	Valid Statistic: Sum Units: None
DeliveryThrottling	The number of log events for which CloudWatch Logs was throttled when forwarding data to the subscription destination. Valid Dimensions: LogGroupName, DestinationType, FilterName Valid Statistic: Sum Units: None

Dimensions for CloudWatch Logs Metrics

The dimensions that you can use with CloudWatch Logs metrics are listed below.

Dimension	Description
LogGroupName	The name of the CloudWatch Logs log group for which to display metrics.
DestinationType	The subscription destination for the CloudWatch Logs data, which can be AWS Lambda, Amazon Kinesis Data Streams, or Amazon Kinesis Data Firehose.
FilterName	The name of the subscription filter that is forwarding data from the log group to the destination. The subscription filter name is automatically converted by CloudWatch to ASCII and any unsupported characters get replaced with a question mark (?).

Amazon Connect Metrics

For information about the Amazon Connect metrics that you can use with CloudWatch, see [Monitoring Amazon Connect Using Amazon CloudWatch Metrics](#) in the Amazon Connect Administrator Guide.

AWS DMS Metrics

For information about the AWS DMS metrics that you can use with CloudWatch, see [Monitoring AWS Database Migration Service Tasks](#) in the AWS Database Migration Service User Guide.

AWS Direct Connect Metrics and Dimensions

By default, CloudWatch provides AWS Direct Connect metric data in 5-minute intervals. You can optionally view data in 1-minute intervals. For more information, see [Monitoring with CloudWatch](#) in the *AWS Direct Connect User Guide*.

AWS Direct Connect Metrics

The following metrics are available from AWS Direct Connect. Metrics are currently available for AWS Direct Connect physical connections only.

Metric	Description
ConnectionState	<p>The state of the connection. 0 indicates DOWN and 1 indicates UP.</p> <p>Units: Boolean</p>
ConnectionBpsEgress	<p>The bit rate for outbound data from the AWS side of the connection.</p> <p>The number reported is the aggregate over the specified time period (5 minutes by default, 1 minute minimum).</p> <p>Units: Bits per second</p>
ConnectionBpsIngress	<p>The bit rate for inbound data to the AWS side of the connection.</p> <p>The number reported is the aggregate over the specified time period (5 minutes by default, 1 minute minimum).</p> <p>Units: Bits per second</p>
ConnectionPpsEgress	<p>The packet rate for outbound data from the AWS side of the connection.</p> <p>The number reported is the aggregate over the specified time period (5 minutes by default, 1 minute minimum).</p> <p>Units: Packets per second</p>
ConnectionPpsIngress	<p>The packet rate for inbound data to the AWS side of the connection.</p> <p>The number reported is the aggregate over the specified time period (5 minutes by default, 1 minute minimum).</p> <p>Units: Packets per second</p>
ConnectionCRCErrorCount	<p>The number of times cyclic redundancy check (CRC) errors are observed for the data received at the connection.</p> <p>Units: Integer</p>
ConnectionLightLevelTx	<p>Indicates the health of the fiber connection for egress (outbound) traffic from the AWS side of the connection.</p> <p>This metric is available for connections with 10 Gbps port speeds only.</p>

Metric	Description
	Units: dBm
ConnectionLightLevelRx	Indicates the health of the fiber connection for ingress (inbound) traffic to the AWS side of the connection. This metric is available for connections with 10 Gbps port speeds only. Units: dBm

Dimensions for AWS Direct Connect Metrics

You can filter the AWS Direct Connect data using the following dimensions.

Dimension	Description
ConnectionId	This dimension filters the data by the AWS Direct Connect connection.

Amazon DynamoDB Metrics and Dimensions

Amazon DynamoDB sends metrics to CloudWatch. For more information, see [Monitoring DynamoDB Tables with Amazon CloudWatch](#) in the *Amazon DynamoDB Developer Guide*.

DynamoDB Metrics

The following metrics are available from Amazon DynamoDB. Note that DynamoDB only sends metrics to CloudWatch when they have a non-zero value. For example, the `UserErrors` metric is incremented whenever a request generates an HTTP 400 status code. If no HTTP 400 errors were encountered during a time period, CloudWatch will not provide metrics for `UserErrors` during that period.

Note

Amazon CloudWatch aggregates the following DynamoDB metrics at one-minute intervals:

- `ConditionalCheckFailedRequests`
- `ConsumedReadCapacityUnits`
- `ConsumedWriteCapacityUnits`
- `ReadThrottleEvents`
- `ReturnedBytes`
- `ReturnedItemCount`
- `ReturnedRecordsCount`
- `SuccessfulRequestLatency`
- `SystemErrors`
- `TimeToLiveDeletedItemCount`
- `ThrottledRequests`
- `UserErrors`
- `WriteThrottleEvents`

For all other DynamoDB metrics, the aggregation granularity is five minutes.

Not all statistics, such as *Average* or *Sum*, are applicable for every metric. However, all of these values are available through the Amazon DynamoDB console, or by using the CloudWatch console, AWS CLI, or AWS SDKs for all metrics. In the following table, each metric has a list of Valid Statistics that is applicable to that metric.

Metric	Description
ConditionalCheckFailedRequests	<p>The number of failed attempts to perform conditional writes. The <code>PutItem</code>, <code>UpdateItem</code>, and <code>DeleteItem</code> operations let you provide a logical condition that must evaluate to true before the operation can proceed. If this condition evaluates to false, <code>ConditionalCheckFailedRequests</code> is incremented by one.</p> <p>Note A failed conditional write will result in an HTTP 400 error (Bad Request). These events are reflected in the <code>ConditionalCheckFailedRequests</code> metric, but not in the <code>UserErrors</code> metric.</p> <p>Units: Count</p> <p>Dimensions: <code>TableName</code></p> <p>Valid Statistics:</p> <ul style="list-style-type: none"> • Minimum • Maximum • Average • SampleCount • Sum
ConsumedReadCapacityUnits	<p>The number of read capacity units consumed over the specified time period, so you can track how much of your provisioned throughput is used. You can retrieve the total consumed read capacity for a table and all of its global secondary indexes, or for a particular global secondary index. For more information, see Provisioned Throughput in Amazon DynamoDB.</p> <p>Note Use the <code>Sum</code> statistic to calculate the consumed throughput. For example, get the <code>Sum</code> value over a span of one minute, and divide it by the number of seconds in a minute (60) to calculate the average <code>ConsumedReadCapacityUnits</code> per second (recognizing that this average will not highlight any large but brief spikes in read activity that occurred during that minute). You can compare the calculated value to the provisioned throughput value you provide DynamoDB.</p> <p>Units: Count</p> <p>Dimensions: <code>TableName</code>, <code>GlobalSecondaryIndexName</code></p> <p>Valid Statistics:</p>

Metric	Description
	<ul style="list-style-type: none"> • Minimum – Minimum number of read capacity units consumed by any individual request to the table or index. • Maximum – Maximum number of read capacity units consumed by any individual request to the table or index. • Average – Average per-request read capacity consumed. • Sum – Total read capacity units consumed. This is the most useful statistic for the <code>ConsumedReadCapacityUnits</code> metric. • SampleCount – Number of requests to DynamoDB that consumed read capacity.
ConsumedWriteCapacityUnits	<p>The number of write capacity units consumed over the specified time period, so you can track how much of your provisioned throughput is used. You can retrieve the total consumed write capacity for a table and all of its global secondary indexes, or for a particular global secondary index. For more information, see Provisioned Throughput in Amazon DynamoDB.</p> <p>Note Use the <code>Sum</code> statistic to calculate the consumed throughput. For example, get the <code>Sum</code> value over a span of one minute, and divide it by the number of seconds in a minute (60) to calculate the average <code>ConsumedWriteCapacityUnits</code> per second (recognizing that this average will not highlight any large but brief spikes in write activity that occurred during that minute). You can compare the calculated value to the provisioned throughput value you provide DynamoDB.</p> <p>Units: Count</p> <p>Dimensions: <code>TableName</code>, <code>GlobalSecondaryIndexName</code></p> <p>Valid Statistics:</p> <ul style="list-style-type: none"> • Minimum – Minimum number of write capacity units consumed by any individual request to the table or index. • Maximum – Maximum number of write capacity units consumed by any individual request to the table or index. • Average – Average per-request write capacity consumed. • Sum – Total write capacity units consumed. This is the most useful statistic for the <code>ConsumedWriteCapacityUnits</code> metric. • SampleCount – Number of requests to DynamoDB that consumed write capacity.

Metric	Description
OnlineIndexConsumedWriteCapacity	<p>The number of write capacity units consumed when adding a new global secondary index to a table. If the write capacity of the index is too low, incoming write activity during the backfill phase might be throttled; this can increase the time it takes to create the index. You should monitor this statistic while the index is being built to determine whether the write capacity of the index is underprovisioned.</p> <p>You can adjust the write capacity of the index using the <code>UpdateTable</code> operation, even while the index is still being built.</p> <p>Note that the <code>ConsumedWriteCapacityUnits</code> metric for the index does not include the write throughput consumed during index creation.</p> <p>Units: Count</p> <p>Dimensions: <code>TableName</code>, <code>GlobalSecondaryIndexName</code></p> <p>Valid Statistics:</p> <ul style="list-style-type: none"> • Minimum • Maximum • Average • SampleCount • Sum
OnlineIndexPercentageProgress	<p>The percentage of completion when a new global secondary index is being added to a table. DynamoDB must first allocate resources for the new index, and then backfill attributes from the table into the index. For large tables, this process might take a long time. You should monitor this statistic to view the relative progress as DynamoDB builds the index.</p> <p>Units: Count</p> <p>Dimensions: <code>TableName</code>, <code>GlobalSecondaryIndexName</code></p> <p>Valid Statistics:</p> <ul style="list-style-type: none"> • Minimum • Maximum • Average • SampleCount • Sum

Metric	Description
OnlineIndexThrottleEvents	<p>The number of write throttle events that occur when adding a new global secondary index to a table. These events indicate that the index creation will take longer to complete, because incoming write activity is exceeding the provisioned write throughput of the index.</p> <p>You can adjust the write capacity of the index using the <code>UpdateTable</code> operation, even while the index is still being built.</p> <p>Note that the <code>WriteThrottleEvents</code> metric for the index does not include any throttle events that occur during index creation.</p> <p>Units: Count</p> <p>Dimensions: <code>TableName</code>, <code>GlobalSecondaryIndexName</code></p> <p>Valid Statistics:</p> <ul style="list-style-type: none">• Minimum• Maximum• Average• SampleCount• Sum
PendingReplicationCount	<p>(This metric is for DynamoDB global tables.) The number of item updates that are written to one replica table, but that have not yet been written to another replica in the global table.</p> <p>Units: Count</p> <p>Dimensions: <code>TableName</code>, <code>ReceivingRegion</code></p> <p>Valid Statistics:</p> <ul style="list-style-type: none">• Average• Sample Count• Sum

Metric	Description
ProvisionedReadCapacityUnits	<p>The number of provisioned read capacity units for a table or a global secondary index.</p> <p>The <code>TableName</code> dimension returns the <code>ProvisionedReadCapacityUnits</code> for the table, but not for any global secondary indexes. To view <code>ProvisionedReadCapacityUnits</code> for a global secondary index, you must specify both <code>TableName</code> and <code>GlobalSecondaryIndex</code>.</p> <p>Units: Count</p> <p>Dimensions: <code>TableName</code>, <code>GlobalSecondaryIndexName</code></p> <p>Valid Statistics:</p> <ul style="list-style-type: none">• Minimum – Lowest setting for provisioned read capacity. If you use <code>UpdateTable</code> to increase read capacity, this metric shows the lowest value of provisioned <code>ReadCapacityUnits</code> during this time period.• Maximum – Highest setting for provisioned read capacity. If you use <code>UpdateTable</code> to decrease read capacity, this metric shows the highest value of provisioned <code>ReadCapacityUnits</code> during this time period.• Average – Average provisioned read capacity. The <code>ProvisionedReadCapacityUnits</code> metric is published at five-minute intervals. Therefore, if you rapidly adjust the provisioned read capacity units, this statistic might not reflect the true average.

Metric	Description
<code>ProvisionedWriteCapacityUnits</code>	<p>The number of provisioned write capacity units for a table or a global secondary index</p> <p>The <code>TableName</code> dimension returns the <code>ProvisionedWriteCapacityUnits</code> for the table, but not for any global secondary indexes. To view <code>ProvisionedWriteCapacityUnits</code> for a global secondary index, you must specify both <code>TableName</code> and <code>GlobalSecondaryIndexName</code>.</p> <p>Units: Count</p> <p>Dimensions: <code>TableName</code>, <code>GlobalSecondaryIndexName</code></p> <p>Valid Statistics:</p> <ul style="list-style-type: none"> • Minimum – Lowest setting for provisioned write capacity. If you use <code>UpdateTable</code> to increase write capacity, this metric shows the lowest value of provisioned <code>WriteCapacityUnits</code> during this time period. • Maximum – Highest setting for provisioned write capacity. If you use <code>UpdateTable</code> to decrease write capacity, this metric shows the highest value of provisioned <code>WriteCapacityUnits</code> during this time period. • Average – Average provisioned write capacity. The <code>ProvisionedWriteCapacityUnits</code> metric is published at five-minute intervals. Therefore, if you rapidly adjust the provisioned write capacity units, this statistic might not reflect the true average.
<code>ReadThrottleEvents</code>	<p>Requests to DynamoDB that exceed the provisioned read capacity units for a table or a global secondary index.</p> <p>A single request can result in multiple events. For example, a <code>BatchGetItem</code> that reads 10 items is processed as ten <code>GetItem</code> events. For each event, <code>ReadThrottleEvents</code> is incremented by one if that event is throttled. The <code>ThrottledRequests</code> metric for the entire <code>BatchGetItem</code> is not incremented unless <i>all ten</i> of the <code>GetItem</code> events are throttled.</p> <p>The <code>TableName</code> dimension returns the <code>ReadThrottleEvents</code> for the table, but not for any global secondary indexes. To view <code>ReadThrottleEvents</code> for a global secondary index, you must specify both <code>TableName</code> and <code>GlobalSecondaryIndexName</code>.</p> <p>Units: Count</p> <p>Dimensions: <code>TableName</code>, <code>GlobalSecondaryIndexName</code></p> <p>Valid Statistics:</p> <ul style="list-style-type: none"> • <code>SampleCount</code> • <code>Sum</code>

Metric	Description
ReplicationLatency	<p>(This metric is for DynamoDB global tables.) The elapsed time between an updated item appearing in the DynamoDB stream for one replica table, and that item appearing in another replica in the global table.</p> <p>Units: Milliseconds</p> <p>Dimensions: TableName, ReceivingRegion</p> <p>Valid Statistics:</p> <ul style="list-style-type: none">• Average• Minimum• Maximum
ReturnedBytes	<p>The number of bytes returned by GetRecords operations (Amazon DynamoDB Streams) during the specified time period.</p> <p>Units: Bytes</p> <p>Dimensions: Operation, StreamLabel, TableName</p> <p>Valid Statistics:</p> <ul style="list-style-type: none">• Minimum• Maximum• Average• SampleCount• Sum
ReturnedItemCount	<p>The number of items returned by Query or Scan operations during the specified time period.</p> <p>Note that the number of items <i>returned</i> is not necessarily the same as the number of items that were evaluated. For example, suppose you requested a Scan on a table that had 100 items, but specified a FilterExpression that narrowed the results so that only 15 items were returned. In this case, the response from Scan would contain a ScanCount of 100 and a Count of 15 returned items.</p> <p>Units: Count</p> <p>Dimensions: TableName, Operation</p> <p>Valid Statistics:</p> <ul style="list-style-type: none">• Minimum• Maximum• Average• SampleCount• Sum

Metric	Description
ReturnedRecordsCount	<p>The number of stream records returned by <code>GetRecords</code> operations (Amazon DynamoDB Streams) during the specified time period.</p> <p>Units: Count</p> <p>Dimensions: Operation, StreamLabel, TableName</p> <p>Valid Statistics:</p> <ul style="list-style-type: none"> • Minimum • Maximum • Average • SampleCount • Sum
SuccessfulRequestLatency	<p>Successful requests to DynamoDB or Amazon DynamoDB Streams during the specified time period. <code>SuccessfulRequestLatency</code> can provide two different kinds of information:</p> <ul style="list-style-type: none"> • The elapsed time for successful requests (Minimum, Maximum, Sum, or Average). • The number of successful requests (SampleCount). <p><code>SuccessfulRequestLatency</code> reflects activity only within DynamoDB or Amazon DynamoDB Streams, and does not take into account network latency or client-side activity.</p> <p>Units: Milliseconds</p> <p>Dimensions: TableName, Operation</p> <p>Valid Statistics:</p> <ul style="list-style-type: none"> • Minimum • Maximum • Average • SampleCount
SystemErrors	<p>Requests to DynamoDB or Amazon DynamoDB Streams that generate an HTTP 500 status code during the specified time period. An HTTP 500 usually indicates an internal service error.</p> <p>Units: Count</p> <p>Dimensions: All dimensions</p> <p>Valid Statistics:</p> <ul style="list-style-type: none"> • Sum • SampleCount

Metric	Description
TimeToLiveDeletedItemCount	<p>The number of items deleted by Time To Live (TTL) during the specified time period. This metric helps you monitor the rate of TTL deletions on your table.</p> <p>Units: Count</p> <p>Dimensions: TableName</p> <p>Valid Statistics:</p> <ul style="list-style-type: none">Sum

Metric	Description
ThrottledRequests	<p>Requests to DynamoDB that exceed the provisioned throughput limits on a resource (such as a table or an index).</p> <p>ThrottledRequests is incremented by one if any event within a request exceeds a provisioned throughput limit. For example, if you update an item in a table with global secondary indexes, there are multiple events—a write to the table, and a write to each index. If one or more of these events are throttled, then ThrottledRequests is incremented by one.</p> <p>Note In a batch request (BatchGetItem or BatchWriteItem), ThrottledRequests is only incremented if <i>every</i> request in the batch is throttled. If any individual request within the batch is throttled, one of the following metrics is incremented:</p> <ul style="list-style-type: none"> ReadThrottleEvents – For a throttled GetItem event within BatchGetItem. WriteThrottleEvents – For a throttled PutItem or DeleteItem event within BatchWriteItem. <p>To gain insight into which event is throttling a request, compare ThrottledRequests with the ReadThrottleEvents and WriteThrottleEvents for the table and its indexes.</p> <p>Note A throttled request will result in an HTTP 400 status code. All such events are reflected in the ThrottledRequests metric, but not in the UserErrors metric.</p> <p>Units: Count</p> <p>Dimensions: TableName, Operation</p> <p>Valid Statistics:</p> <ul style="list-style-type: none"> Sum SampleCount

Metric	Description
UserErrors	<p>Requests to DynamoDB or Amazon DynamoDB Streams that generate an HTTP 400 status code during the specified time period. An HTTP 400 usually indicates a client-side error such as an invalid combination of parameters, attempting to update a nonexistent table, or an incorrect request signature.</p> <p>All such events are reflected in the <code>UserErrors</code> metric, except for the following:</p> <ul style="list-style-type: none">• <i>ProvisionedThroughputExceededException</i> – See the <code>ThrottledRequests</code> metric in this section.• <i>ConditionalCheckFailedException</i> – See the <code>ConditionalCheckFailedRequests</code> metric in this section. <p><code>UserErrors</code> represents the aggregate of HTTP 400 errors for DynamoDB or Amazon DynamoDB Streams requests for the current region and the current AWS account.</p> <p>Units: Count</p> <p>Valid Statistics:</p> <ul style="list-style-type: none">• Sum• SampleCount

Metric	Description
WriteThrottleEvents	<p>Requests to DynamoDB that exceed the provisioned write capacity units for a table or a global secondary index.</p> <p>A single request can result in multiple events. For example, a <code>PutItem</code> request on a table with three global secondary indexes would result in four events—the table write, and each of the three index writes. For each event, the <code>WriteThrottleEvents</code> metric is incremented by one if that event is throttled. For single <code>PutItem</code> requests, if any of the events are throttled, <code>ThrottledRequests</code> is also incremented by one. For <code>BatchWriteItem</code>, the <code>ThrottledRequests</code> metric for the entire <code>BatchWriteItem</code> is not incremented unless all of the individual <code>PutItem</code> or <code>DeleteItem</code> events are throttled.</p> <p>The <code>TableName</code> dimension returns the <code>WriteThrottleEvents</code> for the table, but not for any global secondary indexes. To view <code>WriteThrottleEvents</code> for a global secondary index, you must specify both <code>TableName</code> and <code>GlobalSecondaryIndexName</code>.</p> <p>Units: Count</p> <p>Dimensions: <code>TableName</code>, <code>GlobalSecondaryIndexName</code></p> <p>Valid Statistics:</p> <ul style="list-style-type: none">• Sum• SampleCount

Dimensions for DynamoDB Metrics

The metrics for DynamoDB are qualified by the values for the account, table name, global secondary index name, or operation. You can use the CloudWatch console to retrieve DynamoDB data along any of the dimensions in the table below.

Dimension	Description
GlobalSecondaryIndexName	This dimension limits the data to a global secondary index on a table. If you specify <code>GlobalSecondaryIndexName</code> , you must also specify <code>TableName</code> .
Operation	<p>This dimension limits the data to one of the following DynamoDB operations:</p> <ul style="list-style-type: none">• <code>PutItem</code>• <code>DeleteItem</code>• <code>UpdateItem</code>• <code>GetItem</code>• <code>BatchGetItem</code>• <code>Scan</code>• <code>Query</code>

Dimension	Description
	<ul style="list-style-type: none"> BatchWriteItem <p>In addition, you can limit the data to the following Amazon DynamoDB Streams operation:</p> <ul style="list-style-type: none"> GetRecords
ReceivingRegion	This dimension limits the data to a particular AWS region. It is used with metrics originating from replica tables within a DynamoDB global table.
StreamLabel	This dimension limits the data to a specific stream label. It is used with metrics originating from Amazon DynamoDB Streams GetRecords operations.
TableName	This dimension limits the data to a specific table. This value can be any table name in the current region and the current AWS account.

Amazon EC2 Metrics and Dimensions

Amazon Elastic Compute Cloud (Amazon EC2) sends metrics to CloudWatch for your EC2 instances. Basic (five-minute) monitoring is enabled by default. You can enable detailed (one-minute) monitoring. For information about additional metrics for Amazon EC2 instances that are in an Auto Scaling group, see [Auto Scaling Metrics and Dimensions](#) (p. 104).

For more information about how to monitor Amazon EC2, see [Monitoring Your Instances with CloudWatch](#) in the *Amazon EC2 User Guide for Linux Instances*.

Metric Collection and Calculation on C5 and M5 (Nitro) Instances

Because C5 and M5 instances use the Nitro hypervisor, they publish CloudWatch metrics differently than other instances. All other Amazon EC2 instance types use a Xen-based hypervisor. For more information, see [Nitro Hypervisor](#).

In basic monitoring for EC2 instances, seven pre-selected metrics are available at the five-minute frequency. When you use basic monitoring on any type of EC2 instance (using either hypervisor), the hypervisor measures five separate samples per metric during each five-minute interval. The way that these data points are published to CloudWatch depends on the type of hypervisor used by the instance.

- On Xen instances, these five samples are aggregated and reported to CloudWatch as a single data point at the end of the five-minute interval, with a time stamp corresponding to the beginning of the five-minute interval. The statistic set for this data point includes a `SampleCount` of 1. Because this is treated as a single sample, the `Sum`, `Minimum`, and `Maximum` are all equal to the `Average`.
- On Nitro instances, the data point is published to CloudWatch immediately after the first sample is taken during the interval. When each subsequent sample within the interval occurs, the statistic set for that data point is updated to reflect all the samples taken so far, but the time stamp remains the same. If you are graphing or monitoring the data as it is reported, the statistics for the current data point can appear to change as each sample is taken during the five-minute interval. Each of the five samples taken during the interval are included in the `SampleCount` statistic.

Time	1:01PM	1:02PM	1:03PM	1:04PM	1:05PM
Sample Value	10	15	10	5	10
Published on Xen instances	Nothing yet	Nothing yet	Nothing yet	Nothing yet	Average=10 Sum=10 Minimum=10 Maximum=10 SampleCount=1 Timestamp=1:00PM
Published on Nitro instances	Average=10 Sum=10 Minimum=10 Maximum=10 SampleCount=1 Timestamp=1:00PM	Average=12.5 Sum=25 Minimum=10 Maximum=15 SampleCount=2 Timestamp=1:00PM	Average=11.666 Sum=35 Minimum=10 Maximum=15 SampleCount=3 Timestamp=1:00PM	Average=10 Sum=40 Minimum=5 Maximum=15 SampleCount=4 Timestamp=1:00PM	Average=10 Sum=50 Minimum=5 Maximum=15 SampleCount=5 Timestamp=1:00PM

In the example shown in the preceding table, basic monitoring is being used. A sample is taken each minute over a five-minute interval. On a Xen-based instance, nothing is published until the end of the five-minute interval. At this time (1:05PM), the five samples are aggregated and a single data point is written with a 1:00PM time stamp. This data point has a `SampleCount` of 1 and the `Average`, `Minimum`, and `Maximum` are all 10. This one data point contributes 10 to the `Sum` statistic for the metric.

On a Nitro instance, the data point is first written to CloudWatch at 1:01PM with a time stamp of 1:00PM and a value of 10. At 1:02PM, the new sample of 15 causes the `Average` of the 1:00PM data point to change to 12.5, the average of the two samples. This also changes the `Maximum` to 15. The time stamp of this data point remains 1:00PM. At 1:03PM, the data point `Average` changes to 11.6. Finally, after the last sample at 1:05PM, the `Average` returns to 10. The final `Average` statistic of the data point is 10, but it has contributed 50 to the `Sum` as this five-minute period includes a `SampleCount` of 5 and each of the five samples is included in the `Sum`. The `Minimum` and `Maximum` values reflect the highest and lowest values of the samples taken during the interval.

Because of the way that Nitro instances collect and calculate the data, we recommend that you only set alarms with at least two evaluation periods or require "M out of N" breaching periods, where M is at least 2. This is because on Nitro instances, a single sample during one five-minute period can cause the data point to temporarily breach the threshold, even if subsequent samples in that period bring the final statistic set of this data point to within the threshold. This "mutable" data point in the current sample can cause the alarm to activate during the middle of the interval. For more information, see [Evaluating an Alarm \(p. 268\)](#).

Amazon EC2 Metrics

The following metrics are available by default from each EC2 instance. You can enable additional metrics by installing the CloudWatch agent on the instance. For more information about installing the CloudWatch agent on an instance, see [Collect Metrics and Logs from Amazon EC2 Instances and On-Premises Servers with the CloudWatch Agent \(p. 45\)](#). For more information about the additional metrics that can be collected, see [Metrics Collected by the CloudWatch Agent \(p. 108\)](#).

The AWS/EC2 namespace includes the following CPU credit metrics for your T2 instances.

Metric	Description
CPUCreditUsage	<p>[T2 instances] The number of CPU credits spent by the instance for CPU utilization. One CPU credit equals one vCPU running at 100% utilization for one minute or an equivalent combination of vCPUs, utilization, and time (for example, one vCPU running at 50% utilization for two minutes or two vCPUs running at 25% utilization for two minutes).</p> <p>CPU credit metrics are available at a five-minute frequency only. If you specify a period greater than five minutes, use the <code>Sum</code> statistic instead of the <code>Average</code> statistic.</p> <p>Units: Credits (vCPU-minutes)</p>
CPUCreditBalance	<p>[T2 instances] The number of earned CPU credits that an instance has accrued since it was launched or started. For T2 Standard, the <code>CPUCreditBalance</code> also includes the number of launch credits that have been accrued.</p> <p>Credits are accrued in the credit balance after they are earned, and removed from the credit balance when they are spent. The credit balance has a maximum limit, determined by the instance size. Once the limit is reached, any new credits that are earned are discarded. For T2 Standard, launch credits do not count towards the limit.</p> <p>The credits in the <code>CPUCreditBalance</code> are available for the instance to spend to burst beyond its baseline CPU utilization.</p> <p>When an instance is running, credits in the <code>CPUCreditBalance</code> do not expire. When the instance stops, the <code>CPUCreditBalance</code> does not persist, and all accrued credits are lost.</p> <p>CPU credit metrics are available at a five-minute frequency only.</p> <p>Units: Credits (vCPU-minutes)</p>
CPUSurplusCreditBalance	<p>[T2 Unlimited instances] The number of surplus credits that have been spent by a T2 Unlimited instance when its <code>CPUCreditBalance</code> is zero.</p> <p>The <code>CPUSurplusCreditBalance</code> is paid down by earned CPU credits. If the number of surplus credits exceeds the maximum number of credits the instance can earn in a 24-hour period, the spent surplus credits above the maximum incur an additional charge.</p> <p>Units: Credits (vCPU-minutes)</p>
CPUSurplusCreditsCharged	<p>[T2 Unlimited instances] The number of spent surplus credits that are not paid down by earned CPU credits, and thus incur an additional charge.</p> <p>Spent surplus credits are charged when any of the following occurs:</p>

Metric	Description
	<ul style="list-style-type: none"> The spent surplus credits exceed the maximum number of credits the instance can earn in a 24-hour period. Spent surplus credits above the maximum are charged at the end of the hour. The instance is stopped or terminated. The instance is switched from Unlimited to Standard. <p>Units: Credits (vCPU-minutes)</p>

The AWS/EC2 namespace includes the following instance metrics.

Metric	Description
CPUUtilization	<p>The percentage of allocated EC2 compute units that are currently in use on the instance. This metric identifies the processing power required to run an application upon a selected instance.</p> <p>To use the percentiles statistic, you must enable detailed monitoring.</p> <p>Depending on the instance type, tools in your operating system can show a lower percentage than CloudWatch when the instance is not allocated a full processor core.</p> <p>Units: Percent</p>
DiskReadOps	<p>Completed read operations from all instance store volumes available to the instance in a specified period of time.</p> <p>To calculate the average I/O operations per second (IOPS) for the period, divide the total operations in the period by the number of seconds in that period.</p> <p>Units: Count</p>
DiskWriteOps	<p>Completed write operations to all instance store volumes available to the instance in a specified period of time.</p> <p>To calculate the average I/O operations per second (IOPS) for the period, divide the total operations in the period by the number of seconds in that period.</p> <p>Units: Count</p>
DiskReadBytes	<p>Bytes read from all instance store volumes available to the instance.</p> <p>This metric is used to determine the volume of the data the application reads from the hard disk of the instance. This can be used to determine the speed of the application.</p> <p>The number reported is the number of bytes received during the period. If you are using basic (five-minute) monitoring, you can divide this number by 300 to find Bytes/second. If you have detailed (one-minute) monitoring, divide it by 60.</p> <p>Units: Bytes</p>

Metric	Description
DiskWriteBytes	<p>Bytes written to all instance store volumes available to the instance.</p> <p>This metric is used to determine the volume of the data the application writes onto the hard disk of the instance. This can be used to determine the speed of the application.</p> <p>The number reported is the number of bytes received during the period. If you are using basic (five-minute) monitoring, you can divide this number by 300 to find Bytes/second. If you have detailed (one-minute) monitoring, divide it by 60.</p> <p>Units: Bytes</p>
NetworkIn	<p>The number of bytes received on all network interfaces by the instance. This metric identifies the volume of incoming network traffic to a single instance.</p> <p>The number reported is the number of bytes received during the period. If you are using basic (five-minute) monitoring, you can divide this number by 300 to find Bytes/second. If you have detailed (one-minute) monitoring, divide it by 60.</p> <p>Units: Bytes</p>
NetworkOut	<p>The number of bytes sent out on all network interfaces by the instance. This metric identifies the volume of outgoing network traffic from a single instance.</p> <p>The number reported is the number of bytes sent during the period. If you are using basic (five-minute) monitoring, you can divide this number by 300 to find Bytes/second. If you have detailed (one-minute) monitoring, divide it by 60.</p> <p>Units: Bytes</p>
NetworkPacketsIn	<p>The number of packets received on all network interfaces by the instance. This metric identifies the volume of incoming traffic in terms of the number of packets on a single instance. This metric is available for basic monitoring only.</p> <p>Units: Count</p> <p>Statistics: Minimum, Maximum, Average</p>
NetworkPacketsOut	<p>The number of packets sent out on all network interfaces by the instance. This metric identifies the volume of outgoing traffic in terms of the number of packets on a single instance. This metric is available for basic monitoring only.</p> <p>Units: Count</p> <p>Statistics: Minimum, Maximum, Average</p>

The `AWS/EC2` namespace includes the following status checks metrics. By default, status check metrics are available at a 1-minute frequency at no charge. For a newly-launched instance, status check metric data is only available after the instance has completed the initialization state (within a few minutes

of the instance entering the running state). For more information about EC2 status checks, see [Status Checks For Your Instances](#).

Metric	Description
StatusCheckFailed	<p>Reports whether the instance has passed both the instance status check and the system status check in the last minute.</p> <p>This metric can be either 0 (passed) or 1 (failed).</p> <p>By default, this metric is available at a 1-minute frequency at no charge.</p> <p>Units: Count</p>
StatusCheckFailed_Instance	<p>Reports whether the instance has passed the instance status check in the last minute.</p> <p>This metric can be either 0 (passed) or 1 (failed).</p> <p>By default, this metric is available at a 1-minute frequency at no charge.</p> <p>Units: Count</p>
StatusCheckFailed_System	<p>Reports whether the instance has passed the system status check in the last minute.</p> <p>This metric can be either 0 (passed) or 1 (failed).</p> <p>By default, this metric is available at a 1-minute frequency at no charge.</p> <p>Units: Count</p>

Amazon CloudWatch data for a new EC2 instance typically becomes available within one minute of the end of the first period of time requested (the *aggregation period*) in the query. You can set the period—the length of time over which statistics are aggregated—with the Period parameter. For more information on periods, see [Periods \(p. 6\)](#).

You can use the currently available dimensions for EC2 instances (for example, `ImageId` or `InstanceType`) to refine the metrics returned. For information about the dimensions you can use with EC2, see [Dimensions for Amazon EC2 Metrics \(p. 140\)](#).

The AWS/EC2 namespace includes the following Amazon EBS metrics for your C5 and M5 instances.

Metric	Description
EBSReadOps	<p>Completed read operations from all Amazon EBS volumes attached to the instance in a specified period of time.</p> <p>To calculate the average read I/O operations per second (Read IOPS) for the period, divide the total operations in the period by the number of seconds in that period. If you are using basic (five-minute) monitoring, you can divide this number by 300 to calculate the Read IOPS. If</p>

Metric	Description
	<p>you have detailed (one-minute) monitoring, divide it by 60.</p> <p>Unit: Count</p>
EBSWriteOps	<p>Completed write operations to all EBS volumes attached to the instance in a specified period of time.</p> <p>To calculate the average write I/O operations per second (Write IOPS) for the period, divide the total operations in the period by the number of seconds in that period. If you are using basic (five-minute) monitoring, you can divide this number by 300 to calculate the Write IOPS. If you have detailed (one-minute) monitoring, divide it by 60.</p> <p>Unit: Count</p>
EBSReadBytes	<p>Bytes read from all EBS volumes attached to the instance in a specified period of time.</p> <p>The number reported is the number of bytes read during the period. If you are using basic (five-minute) monitoring, you can divide this number by 300 to find Read Bytes/second. If you have detailed (one-minute) monitoring, divide it by 60.</p> <p>Unit: Bytes</p>
EBSWriteBytes	<p>Bytes written to all EBS volumes attached to the instance in a specified period of time.</p> <p>The number reported is the number of bytes written during the period. If you are using basic (five-minute) monitoring, you can divide this number by 300 to find Write Bytes/second. If you have detailed (one-minute) monitoring, divide it by 60.</p> <p>Unit: Bytes</p>
EBSIOBalance%	<p>Available only for the smaller C5 and M5 instance sizes. Provides information about the percentage of I/O credits remaining in the burst bucket. This metric is available for basic monitoring only.</p> <p>The Sum statistic is not applicable to this metric.</p> <p>Unit: Percent</p>
EBSByteBalance%	<p>Available only for the smaller C5 and M5 instance sizes. Provides information about the percentage of throughput credits remaining in the burst bucket. This metric is available for basic monitoring only.</p> <p>The Sum statistic is not applicable to this metric.</p> <p>Unit: Percent</p>

Dimensions for Amazon EC2 Metrics

If you're using Detailed Monitoring, you can filter the EC2 instance data using any of the dimensions in the following table.

Dimension	Description
AutoScalingGroupName	This dimension filters the data you request for all instances in a specified capacity group. An <i>Auto Scaling group</i> is a collection of instances you define if you're using Auto Scaling. This dimension is available only for Amazon EC2 metrics when the instances are in such an Auto Scaling group. Available for instances with Detailed or Basic Monitoring enabled.
ImageId	This dimension filters the data you request for all instances running this Amazon EC2 Amazon Machine Image (AMI). Available for instances with Detailed Monitoring enabled.
InstanceId	This dimension filters the data you request for the identified instance only. This helps you pinpoint an exact instance from which to monitor data.
InstanceType	This dimension filters the data you request for all instances running with this specified instance type. This helps you categorize your data by the type of instance running. For example, you might compare data from an m1.small instance and an m1.large instance to determine which has the better business value for your application. Available for instances with Detailed Monitoring enabled.

Amazon EC2 Spot Fleet Metrics and Dimensions

Amazon Elastic Compute Cloud (Amazon EC2) sends information about your Spot fleet to CloudWatch. For more information, see [CloudWatch Metrics for Spot Fleet](#) in the *Amazon EC2 User Guide for Linux Instances*.

Amazon EC2 Spot Fleet Metrics

The `AWS/EC2Spot` namespace includes the following metrics, plus the CloudWatch metrics for the Spot instances in your fleet.

The `AWS/EC2Spot` namespace includes the following metrics.

Metric	Description
AvailableInstancePoolsCount	The Spot Instance pools specified in the Spot Fleet request. Units: Count
BidsSubmittedForCapacity	The capacity for which Amazon EC2 has submitted bids. Units: Count
EligibleInstancePoolCount	The Spot Instance pools specified in the Spot Fleet request where Amazon EC2 can fulfill bids. Amazon EC2 will not fulfill

Metric	Description
	bids in pools where your bid price is less than the Spot price or the Spot price is greater than the price for On-Demand instances. Units: Count
FulfilledCapacity	The capacity that Amazon EC2 has fulfilled. Units: Count
MaxPercentCapacityAllocation	The maximum value of PercentCapacityAllocation across all Spot Instance pools specified in the Spot Fleet request. Units: Percent
PendingCapacity	The difference between TargetCapacity and FulfilledCapacity. Units: Count
PercentCapacityAllocation	The capacity allocated for the Spot Instance pool for the specified dimensions. To get the maximum value recorded across all Spot Instance pools, use MaxPercentCapacityAllocation. Units: Percent
TargetCapacity	The target capacity of the Spot Fleet request. Units: Count
TerminatingCapacity	The capacity that is being terminated due to Spot Instance interruptions. Units: Count

If the unit of measure for a metric is Count, the most useful statistic is Average.

Dimensions for Amazon EC2 Spot Fleet Metrics

You can filter the data using the following dimensions.

Dimensions	Description
AvailabilityZone	Filter the data by Availability Zone.
FleetRequestId	Filter the data by Spot Fleet request.
InstanceType	Filter the data by instance type.

Amazon ECS Metrics and Dimensions

Amazon Elastic Container Service (Amazon ECS) sends metrics to Amazon CloudWatch. For more information, see [Amazon ECS CloudWatch Metrics](#) in the *Amazon Elastic Container Service Developer Guide*.

Amazon ECS Metrics

Amazon ECS provides metrics for you to monitor the CPU and memory reservation and utilization across your cluster as a whole, and the CPU and memory utilization on the services in your clusters.

The metrics made available will depend on the launch type of the tasks and services in your clusters. If you are using the Fargate launch type for your services then CPU and memory utilization metrics are provided to assist in the monitoring of your services. For the Amazon EC2 launch type you will own and need to monitor the EC2 instances that make your underlying infrastructure so additional CPU and memory reservation and utilization metrics are made available at the cluster, service, and task level.

Amazon ECS sends the following metrics to CloudWatch every minute. When Amazon ECS collects metrics, it collects multiple data points every minute. It then aggregates them to one data point before sending the data to CloudWatch. So in CloudWatch, one sample count is actually the aggregate of multiple data points during one minute.

The AWS/ECS namespace includes the following metrics.

Metric	Description
CPUReservation	<p>The percentage of CPU units that are reserved by running tasks in the cluster.</p> <p>Cluster CPU reservation (this metric can only be filtered by <code>ClusterName</code>) is measured as the total CPU units that are reserved by Amazon ECS tasks on the cluster, divided by the total CPU units that were registered for all of the container instances in the cluster. This metric is only used for tasks using the EC2 launch type.</p> <p>Valid Dimensions: <code>ClusterName</code>, <code>ServiceName</code></p> <p>Valid Statistics: Average, Minimum, Maximum, Sum, Sample Count.</p> <p>Unit: Percent</p>
CPUUtilization	<p>The percentage of CPU units that are used in the cluster or service.</p> <p>Cluster CPU utilization (metrics that are filtered by <code>ClusterName</code> without <code>ServiceName</code>) is measured as the total CPU units in use by Amazon ECS tasks on the cluster, divided by the total CPU units that were registered for all of the container instances in the cluster. Cluster CPU utilization metrics are only used for tasks using the EC2 launch type.</p> <p>Service CPU utilization (metrics that are filtered by <code>ClusterName</code> and <code>ServiceName</code>) is measured as the total CPU units in use by the tasks that belong to the service, divided by the total number of CPU units that are reserved for the tasks that belong to the service. Service CPU utilization metrics are used for tasks using both the Fargate and the EC2 launch type.</p> <p>Valid Dimensions: <code>ClusterName</code>, <code>ServiceName</code></p>

Metric	Description
	<p>Valid Statistics: Average, Minimum, Maximum, Sum, Sample Count.</p> <p>Unit: Percent</p>
MemoryReservation	<p>The percentage of memory that is reserved by running tasks in the cluster.</p> <p>Cluster memory reservation (this metric can only be filtered by <code>ClusterName</code>) is measured as the total memory that is reserved by Amazon ECS tasks on the cluster, divided by the total amount of memory that was registered for all of the container instances in the cluster. This metric is only used for tasks using the EC2 launch type.</p> <p>Valid Dimensions: <code>ClusterName</code>, <code>ServiceName</code></p> <p>Valid Statistics: Average, Minimum, Maximum, Sum, Sample Count.</p> <p>Unit: Percent</p>
MemoryUtilization	<p>The percentage of memory that is used in the cluster or service.</p> <p>Cluster memory utilization (metrics that are filtered by <code>ClusterName</code> without <code>ServiceName</code>) is measured as the total memory in use by Amazon ECS tasks on the cluster, divided by the total amount of memory that was registered for all of the container instances in the cluster. Cluster memory utilization metrics are only used for tasks using the EC2 launch type.</p> <p>Service memory utilization (metrics that are filtered by <code>ClusterName</code> and <code>ServiceName</code>) is measured as the total memory in use by the tasks that belong to the service, divided by the total memory that is reserved for the tasks that belong to the service. Service memory utilization metrics are used for tasks using both the Fargate and the EC2 launch type.</p> <p>Valid Dimensions: <code>ClusterName</code>, <code>ServiceName</code></p> <p>Valid Statistics: Average, Minimum, Maximum, Sum, Sample Count.</p> <p>Unit: Percent</p>

Note

If you are using tasks with the EC2 launch type and have Linux container instances, the Amazon ECS container agent relies on Docker `stats` metrics to gather CPU and memory data for each container running on the instance. If you are using an Amazon ECS agent prior to version 1.14.0, ECS includes filesystem cache usage when reporting memory utilization to CloudWatch so your CloudWatch graphs show a higher than actual memory utilization for tasks. To remediate this, starting with Amazon ECS agent version 1.14.0, the Amazon ECS container agent excludes the

filesystem cache usage from the memory utilization metric. This change does not impact the out-of-memory behavior of containers.

Dimensions for Amazon ECS Metrics

Amazon ECS metrics use the `AWS/ECS` namespace and provide metrics for the following dimensions:

Dimension	Description
<code>ClusterName</code>	This dimension filters the data you request for all resources in a specified cluster. All Amazon ECS metrics are filtered by <code>ClusterName</code> .
<code>ServiceName</code>	This dimension filters the data you request for all resources in a specified service within a specified cluster.

AWS Elastic Beanstalk Metrics and Dimensions

AWS Elastic Beanstalk sends metrics to Amazon CloudWatch. For more information, see [Publishing Amazon CloudWatch Custom Metrics for an Environment](#) in the *AWS Elastic Beanstalk Developer Guide*.

Elastic Beanstalk Metrics

The `AWS/ElasticBeanstalk` namespace includes the following metrics.

Metric	Description
<code>EnvironmentHealth</code>	[Environment] The health status of the environment. The possible values are 0 (OK), 1 (Info), 5 (Unknown), 10 (No data), 15 (Warning), 20 (Degraded) and 25 (Severe).
<code>InstancesOk</code>	[Environment] The number of instances with OK health status.
<code>InstancesPending</code>	[Environment] The number of instances with Pending health status.
<code>InstancesInfo</code>	[Environment] The number of instances with Info health status.
<code>InstancesUnknown</code>	[Environment] The number of instances with Unknown health status.
<code>InstancesNoData</code>	[Environment] The number of instances with no health status data.
<code>InstancesWarning</code>	[Environment] The number of instances with Warning health status.
<code>InstancesDegraded</code>	[Environment] The number of instances with Degraded health status.
<code>InstancesSevere</code>	[Environment] The number of instances with Severe health status.
<code>ApplicationRequestsTotal</code>	The number of requests completed by the instance or environment.
<code>ApplicationRequests2xx</code>	The number of requests that completed with a 2XX status code.
<code>ApplicationRequests3xx</code>	The number of requests that completed with a 3XX status code.

Metric	Description
ApplicationRequests4xx	The number of requests that completed with a 4XX status code.
ApplicationRequests5xx	The number of requests that completed with a 5XX status code.
ApplicationLatencyP10	The average time to complete the fastest 10 percent of requests.
ApplicationLatencyP50	The average time to complete the fastest 50 percent of requests.
ApplicationLatencyP75	The average time to complete the fastest 75 percent of requests.
ApplicationLatencyP85	The average time to complete the fastest 85 percent of requests.
ApplicationLatencyP90	The average time to complete the fastest 90 percent of requests.
ApplicationLatencyP95	The average time to complete the fastest 95 percent of requests.
ApplicationLatencyP99	The average time to complete the fastest 99 percent of requests.
ApplicationLatencyP99.9	The average time to complete the fastest x percent of requests.
LoadAverage1min	[Instance] The average CPU load over the last minute.
InstanceHealth	[Instance] The health status of the instance.
RootFilesystemUtil	[Instance] The percentage of disk space in use.
CPUIrq	[Instance] The percentage of time the CPU was in this state in the last minute.
CPUser	[Instance] The percentage of time the CPU was in this state in the last minute.
CPUIidle	[Instance] The percentage of time the CPU was in this state in the last minute.
CPUSystem	[Instance] The percentage of time the CPU was in this state in the last minute.
CPUSoftirq	[Instance] The percentage of time the CPU was in this state in the last minute.
CPUIowait	[Instance] The percentage of time the CPU was in this state in the last minute.
CPUNice	[Instance] The percentage of time the CPU was in this state in the last minute.

Dimensions for Elastic Beanstalk Metrics

You can filter the data using the following dimensions.

Dimensions	Description
EnvironmentName	Filter the data by environment.
InstanceId	Filter the data by instance.

Amazon ElastiCache Metrics and Dimensions

Amazon ElastiCache sends metrics to Amazon CloudWatch. For more information, see [Viewing Cache Cluster and Cache Node Metrics](#) in the *Amazon ElastiCache User Guide*.

Contents

- [Dimensions for ElastiCache Metrics](#) (p. 146)
- [Host-Level Metrics](#) (p. 146)
- [Metrics for Memcached](#) (p. 147)
- [Metrics for Redis](#) (p. 149)

Dimensions for ElastiCache Metrics

All ElastiCache metrics use the `AWS/ElastiCache` namespace and provide metrics for a single dimension, the `CacheNodeId`, which is the automatically-generated identifier for each cache node in the cache cluster. You can find out what these values are for your cache nodes by using the `DescribeCacheClusters` API or **describe-cache-clusters** command line utility. For more information, see [DescribeCacheClusters](#) in the *Amazon ElastiCache API Reference* and [describe-cache-clusters](#) in the *AWS CLI Command Reference*.

Each metric is published under a single set of dimensions. When retrieving metrics, you must supply both the `CacheClusterId` and `CacheNodeId` dimensions.

Contents

- [Host-Level Metrics](#) (p. 146)
- [Metrics for Memcached](#) (p. 147)
- [Metrics for Redis](#) (p. 149)
- [Which Metrics Should I Monitor?](#)

Host-Level Metrics

The `AWS/ElastiCache` namespace includes the following host-level metrics for individual cache nodes.

See Also

- [Metrics for Memcached](#) (p. 147)
- [Metrics for Redis](#) (p. 149)

Metric	Description	Unit
<code>CPUUtilization</code>	The percentage of CPU utilization.	Percent
<code>FreeableMemory</code>	The amount of free memory available on the host.	Bytes
<code>NetworkBytesIn</code>	The number of bytes the host has read from the network.	Bytes
<code>NetworkBytesOut</code>	The number of bytes the host has written to the network.	Bytes

Metric	Description	Unit
SwapUsage	The amount of swap used on the host.	Bytes

Metrics for Memcached

The AWS/ElastiCache namespace includes the following metrics that are derived from the Memcached **stats** command. Each metric is calculated at the cache node level.

For complete documentation of the Memcached **stats** command, go to <https://github.com/memcached/memcached/blob/master/doc/protocol.txt>.

See Also

- [Host-Level Metrics \(p. 146\)](#)

Metric	Description	Unit
BytesReadIntoMemcached	The number of bytes that have been read from the network by the cache node.	Bytes
BytesUsedForCacheItems	The number of bytes used to store cache items.	Bytes
BytesWrittenOutFromMemcached	The number of bytes that have been written to the network by the cache node.	Bytes
CasBadval	The number of CAS (check and set) requests the cache has received where the Cas value did not match the Cas value stored.	Count
CasHits	The number of Cas requests the cache has received where the requested key was found and the Cas value matched.	Count
CasMisses	The number of Cas requests the cache has received where the key requested was not found.	Count
CmdFlush	The number of flush commands the cache has received.	Count
CmdGet	The number of get commands the cache has received.	Count
CmdSet	The number of set commands the cache has received.	Count
CurrConnections	A count of the number of connections connected to the cache at an instant in time. ElastiCache uses two to three of the connections to monitor the cluster in each case.	Count
CurrItems	A count of the number of items currently stored in the cache.	Count
DecrHits	The number of decrement requests the cache has received where the requested key was found.	Count

Metric	Description	Unit
DecrMisses	The number of decrement requests the cache has received where the requested key was not found.	Count
DeleteHits	The number of delete requests the cache has received where the requested key was found.	Count
DeleteMisses	The number of delete requests the cache has received where the requested key was not found.	Count
Evictions	The number of non-expired items the cache evicted to allow space for new writes.	Count
GetHits	The number of get requests the cache has received where the key requested was found.	Count
GetMisses	The number of get requests the cache has received where the key requested was not found.	Count
IncrHits	The number of increment requests the cache has received where the key requested was found.	Count
IncrMisses	The number of increment requests the cache has received where the key requested was not found.	Count
Reclaimed	The number of expired items the cache evicted to allow space for new writes.	Count

For Memcached 1.4.14, the following additional metrics are provided.

Metric	Description	Unit
BytesUsedForHash	The number of bytes currently used by hash tables.	Bytes
CmdConfigGet	The cumulative number of config get requests.	Count
CmdConfigSet	The cumulative number of config set requests.	Count
CmdTouch	The cumulative number of touch requests.	Count
CurrConfig	The current number of configurations stored.	Count
EvictedUnfetched	The number of valid items evicted from the least recently used cache (LRU) which were never touched after being set.	Count
ExpiredUnfetched	The number of expired items reclaimed from the LRU which were never touched after being set.	Count
SlabsMoved	The total number of slab pages that have been moved.	Count
TouchHits	The number of keys that have been touched and were given a new expiration time.	Count
TouchMisses	The number of items that have been touched, but were not found.	Count

The AWS/ElastiCache namespace includes the following calculated cache-level metrics.

Metric	Description	Unit
NewConnections	The number of new connections the cache has received. This is derived from the memcached <code>total_connections</code> statistic by recording the change in <code>total_connections</code> across a period of time. This will always be at least 1, due to a connection reserved for a ElastiCache.	Count
NewItems	The number of new items the cache has stored. This is derived from the memcached <code>total_items</code> statistic by recording the change in <code>total_items</code> across a period of time.	Count
UnusedMemory	<p>The amount of memory not used by data. This is derived from the Memcached statistics <code>limit_maxbytes</code> and <code>bytes</code> by subtracting <code>bytes</code> from <code>limit_maxbytes</code>.</p> <p>Because Memcached overhead uses memory in addition to that used by data, <code>UnusedMemory</code> should not be considered to be the amount of memory available for additional data. You may experience evictions even though you still have some unused memory.</p> <p>For more detailed information, see Memcached item memory usage.</p>	Bytes

Metrics for Redis

The AWS/ElastiCache namespace includes the following Redis metrics.

With the exception of `ReplicationLag`, these metrics are derived from the Redis **info** command. Each metric is calculated at the cache node level.

For complete documentation of the Redis **info** command, go to <http://redis.io/commands/info>.

See Also

- [Host-Level Metrics \(p. 146\)](#)

Metric	Description	Unit
BytesUsedForCache	The total number of bytes allocated by Redis.	Bytes
CacheHits	The number of successful key lookups.	Count
CacheMisses	The number of unsuccessful key lookups.	Count
CurrConnections	The number of client connections, excluding connections from read replicas. ElastiCache uses two to three of the connections to monitor the cluster in each case.	Count

Metric	Description	Unit
EngineCPUUtilization	CPU utilization of the single core that Redis is running on. Since Redis is single threaded, this is the percent of your thread's capacity that is being used.	Percent
Evictions	The number of keys that have been evicted due to the maxmemory limit.	Count
HyperLogLogBasedCmds	The total number of HyperLogLog based commands. This is derived from the Redis commandstats statistic by summing all of the pf type of commands (pfadd, pfcount, pfmerge).	Count
NewConnections	The total number of connections that have been accepted by the server during this period.	Count
Reclaimed	The total number of key expiration events.	Count
ReplicationBytes	For primaries with attached replicas, ReplicationBytes reports the number of bytes that the primary is sending to all of its replicas. This metric is representative of the write load on the replication group. For replicas and standalone primaries, ReplicationBytes is always 0.	Bytes
ReplicationLag	This metric is only applicable for a node running as a read replica. It represents how far behind, in seconds, the replica is in applying changes from the primary node.	Seconds
SaveInProgress	This binary metric returns 1 whenever a background save (forked or forkless) is in progress, and 0 otherwise. A background save process is typically used during snapshots and syncs. These operations can cause degraded performance. Using the SaveInProgress metric, you can diagnose whether or not degraded performance was caused by a background save process.	Count

EngineCPUUtilization availability

Nodes in a region created or replaced after the date and time specified in the following table will include the EngineCPUUtilization metric.

Region	Region name	EngineCPUUtilization availability	
us-east-2	US East (Ohio)	February 16, 2017	17:21 (UTC)
us-east-1	US East (N. Virginia)	February 8, 2017	21:20 (UTC)
us-west-1	US West (N. California)	February 14, 2017	22:23 (UTC)
us-west-2	US West (Oregon)	February 20, 2017	19:20 (UTC)
ap-northeast-1	Asia Pacific (Tokyo)	February 14, 2017	19:58 (UTC)

Region	Region name	EngineCPUUtilization availability	
ap-northeast-2	Asia Pacific (Seoul)	Available on all nodes.	
ap-northeast-3	Asia Pacific (Osaka-Local)	Available on all nodes.	
ap-south-1	Asia Pacific (Mumbai)	February 7, 2017	02:51 (UTC)
ap-southeast-1	Asia Pacific (Singapore)	February 13, 2017	23:40 (UTC)
ap-southeast-2	Asia Pacific (Sydney)	February 14, 2017	03:33 (UTC)
ca-central-1	Canada (Central)	Available on all nodes.	
cn-north-1	China (Beijing)	February 16, 2017	22:39 (UTC)
cn-northwest-2	China (Ningxia)	Available on all nodes.	
eu-central-1	EU (Frankfurt)	February 15, 2017	00:46 (UTC)
eu-west-1	EU (Ireland)	February 7, 2017	21:30 (UTC)
eu-west-2	EU (London)	February 16, 2017	18:58 (UTC)
eu-west-3	EU (Paris)	Available on all nodes.	
sa-east-1	South America (São Paulo)	February 7, 2017	04:35 (UTC)
us-gov-west-1	AWS GovCloud (US)	February 16, 2017	20:11 (UTC)

These are aggregations of certain kinds of commands, derived from **info commandstats**:

Metric	Description	Unit
CurrItems	The number of items in the cache. This is derived from the Redis <code>keyspace</code> statistic, summing all of the keys in the entire keyspace.	Count
GetTypeCmds	The total number of get types of commands. This is derived from the Redis <code>commandstats</code> statistic by summing all of the get types of commands (get , mget , hget , etc.)	Count
HashBasedCmds	The total number of commands that are hash-based. This is derived from the Redis <code>commandstats</code> statistic by summing all of the commands that act upon one or more hashes.	Count
KeyBasedCmds	The total number of commands that are key-based. This is derived from the Redis <code>commandstats</code> statistic by summing all of the commands that act upon one or more keys.	Count
ListBasedCmds	The total number of commands that are list-based. This is derived from the Redis <code>commandstats</code> statistic by summing all of the commands that act upon one or more lists.	Count
SetBasedCmds	The total number of commands that are set-based. This is derived from the Redis	Count

Metric	Description	Unit
	<code>commandstats</code> statistic by summing all of the commands that act upon one or more sets.	
<code>SetTypeCmds</code>	The total number of set types of commands. This is derived from the Redis <code>commandstats</code> statistic by summing all of the set types of commands (set , hset , etc.)	Count
<code>SortedSetBasedCmds</code>	The total number of commands that are sorted set-based. This is derived from the Redis <code>commandstats</code> statistic by summing all of the commands that act upon one or more sorted sets.	Count
<code>StringBasedCmds</code>	The total number of commands that are string-based. This is derived from the Redis <code>commandstats</code> statistic by summing all of the commands that act upon one or more strings.	Count

Amazon EBS Metrics and Dimensions

Amazon EBS Metrics

Amazon Elastic Block Store (Amazon EBS) sends data points to CloudWatch for several metrics. Amazon EBS General Purpose SSD (gp2), Throughput Optimized HDD (st1), Cold HDD (sc1), and Magnetic (standard) volumes automatically send five-minute metrics to CloudWatch. Provisioned IOPS SSD (io1) volumes automatically send one-minute metrics to CloudWatch. Data is only reported to CloudWatch when the volume is attached to an instance. For more information about how to monitor Amazon EBS, see [Monitoring the Status of Your Volumes](#) in the *Amazon EC2 User Guide for Linux Instances*.

The `AWS/EBS` namespace includes the following metrics.

Metric	Description
<code>VolumeReadBytes</code> <code>VolumeWriteBytes</code>	Provides information on the I/O operations in a specified period of time. The <code>Sum</code> statistic reports the total number of bytes transferred during the period. The <code>Average</code> statistic reports the average size of each I/O operation during the period, except on volumes attached to C5 and M5 instances, where the average represents the average over the specified period. The <code>SampleCount</code> statistic reports the total number of I/O operations during the period, except on volumes attached to C5 and M5 instances, where the sample count represents the number of data points used in the statistical calculation. Data is reported to CloudWatch only when the volume is active. The <code>Minimum</code> and <code>Maximum</code> statistics on this metric are supported only by volumes attached to a C5 or M5 instance. Units: Bytes
<code>VolumeReadOps</code> <code>VolumeWriteOps</code>	The total number of I/O operations in a specified period of time.

Metric	Description
	<p>To calculate the average I/O operations per second (IOPS) for the period, divide the total operations in the period by the number of seconds in that period.</p> <p>The <code>Minimum</code> and <code>Maximum</code> statistics on this metric are supported only by volumes attached to a C5 or M5 instance.</p> <p>Units: Count</p>
<code>VolumeTotalReadTime</code> <code>VolumeTotalWriteTime</code>	<p>The total number of seconds spent by all operations that completed in a specified period of time. If multiple requests are submitted at the same time, this total could be greater than the length of the period. For example, for a period of 5 minutes (300 seconds): if 700 operations completed during that period, and each operation took 1 second, the value would be 700 seconds.</p> <p>The <code>Average</code> statistic on this metric is not relevant for volumes attached to C5 and M5 instances.</p> <p>The <code>Minimum</code> and <code>Maximum</code> statistics on this metric are supported only by volumes attached to a C5 or M5 instance.</p> <p>Units: Seconds</p>
<code>VolumeIdleTime</code>	<p>The total number of seconds in a specified period of time when no read or write operations were submitted.</p> <p>The <code>Average</code> statistic on this metric is not relevant for volumes attached to C5 and M5 instances.</p> <p>The <code>Minimum</code> and <code>Maximum</code> statistics on this metric are supported only by volumes attached to a C5 or M5 instance.</p> <p>Units: Seconds</p>
<code>VolumeQueueLength</code>	<p>The number of read and write operation requests waiting to be completed in a specified period of time.</p> <p>The <code>Sum</code> statistic on this metric is not relevant for volumes attached to C5 and M5 instances.</p> <p>The <code>Minimum</code> and <code>Maximum</code> statistics on this metric are supported only by volumes attached to a C5 or M5 instance.</p> <p>Units: Count</p>

Metric	Description
VolumeThroughputPercentage	<p>Used with Provisioned IOPS SSD volumes only. The percentage of I/O operations per second (IOPS) delivered of the total IOPS provisioned for an Amazon EBS volume. Provisioned IOPS SSD volumes deliver within 10 percent of the provisioned IOPS performance 99.9 percent of the time over a given year.</p> <p>During a write, if there are no other pending I/O requests in a minute, the metric value will be 100 percent. Also, a volume's I/O performance may become degraded temporarily due to an action you have taken (for example, creating a snapshot of a volume during peak usage, running the volume on a non-EBS-optimized instance, or accessing data on the volume for the first time).</p> <p>Units: Percent</p>
VolumeConsumedReadWriteOps	<p>Used with Provisioned IOPS SSD volumes only. The total amount of read and write operations (normalized to 256K capacity units) consumed in a specified period of time.</p> <p>I/O operations that are smaller than 256K each count as 1 consumed IOPS. I/O operations that are larger than 256K are counted in 256K capacity units. For example, a 1024K I/O would count as 4 consumed IOPS.</p> <p>Units: Count</p>
BurstBalance	<p>Used with General Purpose SSD (gp2), Throughput Optimized HDD (st1), and Cold HDD (sc1) volumes only. Provides information about the percentage of I/O credits (for gp2) or throughput credits (for st1 and sc1) remaining in the burst bucket. Data is reported to CloudWatch only when the volume is active. If the volume is not attached, no data is reported.</p> <p>The Sum statistic on this metric is not relevant for volumes attached to C5 and M5 instances.</p> <p>Units: Percent</p>

Dimensions for Amazon EBS Metrics

The only dimension that Amazon EBS sends to CloudWatch is `VolumeId`. All available statistics are filtered by `VolumeId`.

Amazon EFS Metrics and Dimensions

Amazon EFS sends metrics to CloudWatch for every Amazon EFS file system every minute. For more information, see [Monitoring Amazon EFS](#) in the *Amazon Elastic File System User Guide*.

Amazon CloudWatch Metrics for Amazon EFS

The `AWS/EF` namespace includes the following metrics.

Metric	Description
BurstCreditBalance	<p>The number of burst credits that a file system has.</p> <p>Burst credits allow a file system to burst to throughput levels above a file system's baseline level for periods of time. For more information, see Throughput scaling in Amazon EFS.</p> <p>The <code>Minimum</code> statistic is the smallest burst credit balance for any minute during the period. The <code>Maximum</code> statistic is the largest burst credit balance for any minute during the period. The <code>Average</code> statistic is the average burst credit balance during the period.</p> <p>Units: Bytes</p> <p>Valid statistics: <code>Minimum</code>, <code>Maximum</code>, <code>Average</code></p>
ClientConnections	<p>The number of client connections to a file system. When using a standard client, there is one connection per mounted Amazon EC2 instance.</p> <p>Note To calculate the average <code>ClientConnections</code> for periods greater than one minute, divide the <code>Sum</code> statistic by the number of minutes in the period.</p> <p>Units: Count of client connections</p> <p>Valid statistics: <code>Sum</code></p>
DataReadIOBytes	<p>The number of bytes for each file system read operation.</p> <p>The <code>Sum</code> statistic is the total number of bytes associated with read operations. The <code>Minimum</code> statistic is the size of the smallest read operation during the period. The <code>Maximum</code> statistic is the size of the largest read operation during the period. The <code>Average</code> statistic is the average size of read operations during the period. The <code>SampleCount</code> statistic provides a count of read operations.</p> <p>Units:</p> <ul style="list-style-type: none">• Bytes for <code>Minimum</code>, <code>Maximum</code>, <code>Average</code>, and <code>Sum</code>.• Count for <code>SampleCount</code>. <p>Valid statistics: <code>Minimum</code>, <code>Maximum</code>, <code>Average</code>, <code>Sum</code>, <code>SampleCount</code></p>
DataWriteIOBytes	<p>The number of bytes for each file write operation.</p> <p>The <code>Sum</code> statistic is the total number of bytes associated with write operations. The <code>Minimum</code> statistic is the size of the smallest write operation during the period. The <code>Maximum</code> statistic is the size of the largest write operation during the period. The <code>Average</code> statistic is the average size of write operations during the period. The <code>SampleCount</code> statistic provides a count of write operations.</p> <p>Units:</p> <ul style="list-style-type: none">• Bytes are the units for the <code>Minimum</code>, <code>Maximum</code>, <code>Average</code>, and <code>Sum</code> statistics.

Metric	Description
	<ul style="list-style-type: none"> Count for SampleCount. <p>Valid statistics: Minimum, Maximum, Average, Sum, SampleCount</p>
MetadataIOBytes	<p>The number of bytes for each metadata operation.</p> <p>The Sum statistic is the total number of bytes associated with metadata operations. The Minimum statistic is the size of the smallest metadata operation during the period. The Maximum statistic is the size of the largest metadata operation during the period. The Average statistic is the size of the average metadata operation during the period. The SampleCount statistic provides a count of metadata operations.</p> <p>Units:</p> <ul style="list-style-type: none"> Bytes are the units for the Minimum, Maximum, Average, and Sum statistics. Count for SampleCount. <p>Valid statistics: Minimum, Maximum, Average, Sum, SampleCount</p>
PercentIOLimit	<p>Shows how close a file system is to reaching the I/O limit of the General Purpose performance mode. If this metric is at 100% more often than not, consider moving your application to a file system using the Max I/O performance mode.</p> <p>Note This metric is only submitted for file systems using the General Purpose performance mode.</p> <p>Units:</p> <ul style="list-style-type: none"> Percent
PermittedThroughput	<p>The maximum amount of throughput a file system is allowed, given the file system size and BurstCreditBalance. For more information, see Amazon EFS Performance.</p> <p>The Minimum statistic is the smallest throughput permitted for any minute during the period. The Maximum statistic is the highest throughput permitted for any minute during the period. The Average statistic is the average throughput permitted during the period.</p> <p>Units: Bytes per second</p> <p>Valid statistics: Minimum, Maximum, Average</p>

Metric	Description
TotalIOBytes	<p>The number of bytes for each file system operation, including data read, data write, and metadata operations.</p> <p>The <code>Sum</code> statistic is the total number of bytes associated with all file system operations. The <code>Minimum</code> statistic is the size of the smallest operation during the period. The <code>Maximum</code> statistic is the size of the largest operation during the period. The <code>Average</code> statistic is the average size of an operation during the period. The <code>SampleCount</code> statistic provides a count of all operations.</p> <p>Note</p> <p>To calculate the average operations per second for a period, divide the <code>SampleCount</code> statistic by the number of seconds in the period. To calculate the average throughput (Bytes per second) for a period, divide the <code>Sum</code> statistic by the number of seconds in the period.</p> <p>Units:</p> <ul style="list-style-type: none">• Bytes for <code>Minimum</code>, <code>Maximum</code>, <code>Average</code>, and <code>Sum</code> statistics.• Count for <code>SampleCount</code>. <p>Valid statistics: <code>Minimum</code>, <code>Maximum</code>, <code>Average</code>, <code>Sum</code>, <code>SampleCount</code></p>

Dimensions for Amazon EFS Metrics

Amazon EFS Dimensions

Amazon EFS metrics use the `efs` namespace and provides metrics for a single dimension, `FileSystemId`. A file system's ID can be found in the Amazon EFS management console, and it takes the form of `fs-xxxxxxx`.

Elastic Load Balancing Metrics and Dimensions

Elastic Load Balancing supports three types of load balancers: Classic Load Balancers, Application Load Balancers and Network Load Balancers. Elastic Load Balancing sends metrics to CloudWatch for all three types of load balancers.

Application Load Balancer Metrics

The `AWS/ApplicationELB` namespace includes the following metrics.

Metric	Description
ActiveConnectionCount	<p>The total number of concurrent TCP connections active from clients to the load balancer and from the load balancer to targets.</p> <p>Reporting criteria: There is a nonzero value</p> <p>Statistics: The most useful statistic is Sum.</p> <p>Dimensions</p> <ul style="list-style-type: none"> LoadBalancer
ClientTLSNegotiationErrorCount	<p>The number of TLS connections initiated by the client that did not establish a session with the load balancer. Possible causes include a mismatch of ciphers or protocols.</p> <p>Reporting criteria: There is a nonzero value</p> <p>Statistics: The most useful statistic is Sum.</p> <p>Dimensions</p> <ul style="list-style-type: none"> LoadBalancer AvailabilityZone, LoadBalancer
ConsumedLCUs	<p>The number of load balancer capacity units (LCU) used by your load balancer. You pay for the number of LCUs that you use per hour. For more information, see Elastic Load Balancing Pricing.</p> <p>Reporting criteria: There is a nonzero value</p> <p>Statistics: All</p> <p>Dimensions</p> <ul style="list-style-type: none"> LoadBalancer
HealthyHostCount	<p>The number of targets that are considered healthy.</p> <p>Reporting criteria: Always reported</p> <p>Statistics: The most useful statistics are Average, Minimum, and Maximum.</p> <p>Dimensions</p> <ul style="list-style-type: none"> TargetGroup, LoadBalancer TargetGroup, AvailabilityZone, LoadBalancer
HTTPCode_ELB_4XX_Count	<p>The number of HTTP 4XX client error codes that originate from the load balancer. Client errors are generated when requests are malformed or incomplete. These requests have not been received by the target. This count does not include any response codes generated by the targets.</p> <p>Reporting criteria: There is a nonzero value</p> <p>Statistics: The most useful statistic is Sum. Note that Minimum, Maximum, and Average all return 1.</p>

Metric	Description
	Dimensions <ul style="list-style-type: none"> LoadBalancer AvailabilityZone, LoadBalancer
HTTPCode_ELB_5XX_Count	<p>The number of HTTP 5XX server error codes that originate from the load balancer. This count does not include any response codes generated by the targets.</p> <p>Reporting criteria: There is a nonzero value</p> <p>Statistics: The most useful statistic is Sum. Note that Minimum, Maximum, and Average all return 1.</p> <p>Dimensions</p> <ul style="list-style-type: none"> LoadBalancer AvailabilityZone, LoadBalancer
HTTPCode_Target_2XX_Count, HTTPCode_Target_3XX_Count, HTTPCode_Target_4XX_Count, HTTPCode_Target_5XX_Count	<p>The number of HTTP response codes generated by the targets. This does not include any response codes generated by the load balancer.</p> <p>Reporting criteria: There is a nonzero value</p> <p>Statistics: The most useful statistic is Sum. Note that Minimum, Maximum, and Average all return 1.</p> <p>Dimensions</p> <ul style="list-style-type: none"> LoadBalancer AvailabilityZone, LoadBalancer TargetGroup, LoadBalancer TargetGroup, AvailabilityZone, LoadBalancer
IPv6ProcessedBytes	<p>The total number of bytes processed by the load balancer over IPv6.</p> <p>Reporting criteria: There is a nonzero value</p> <p>Statistics: The most useful statistic is Sum.</p> <p>Dimensions</p> <ul style="list-style-type: none"> LoadBalancer

Metric	Description
IPv6RequestCount	<p>The number of IPv6 requests received by the load balancer.</p> <p>Reporting criteria: There is a nonzero value</p> <p>Statistics: The most useful statistic is Sum. Note that Minimum, Maximum, and Average all return 1.</p> <p>Dimensions</p> <ul style="list-style-type: none"> LoadBalancer AvailabilityZone, LoadBalancer TargetGroup, LoadBalancer TargetGroup, AvailabilityZone, LoadBalancer
NewConnectionCount	<p>The total number of new TCP connections established from clients to the load balancer and from the load balancer to targets.</p> <p>Reporting criteria: There is a nonzero value</p> <p>Statistics: The most useful statistic is Sum.</p> <p>Dimensions</p> <ul style="list-style-type: none"> LoadBalancer
ProcessedBytes	<p>The total number of bytes processed by the load balancer over IPv4 and IPv6.</p> <p>Reporting criteria: There is a nonzero value</p> <p>Statistics: The most useful statistic is Sum.</p> <p>Dimensions</p> <ul style="list-style-type: none"> LoadBalancer
RejectedConnectionCount	<p>The number of connections that were rejected because the load balancer had reached its maximum number of connections.</p> <p>Reporting criteria: There is a nonzero value</p> <p>Statistics: The most useful statistic is Sum.</p> <p>Dimensions</p> <ul style="list-style-type: none"> LoadBalancer AvailabilityZone, LoadBalancer

Metric	Description
RequestCount	<p>The number of requests processed over IPv4 and IPv6. This count includes only the requests with a response generated by a target of the load balancer.</p> <p>Reporting criteria: Always reported</p> <p>Statistics: The most useful statistic is Sum. Note that Minimum, Maximum, and Average all return 1.</p> <p>Dimensions</p> <ul style="list-style-type: none"> • LoadBalancer • AvailabilityZone, LoadBalancer • TargetGroup, LoadBalancer • TargetGroup, AvailabilityZone, LoadBalancer
RequestCountPerTarget	<p>The average number of requests received by each target in a target group. You must specify the target group using the TargetGroup dimension.</p> <p>Reporting criteria: There is a nonzero value</p> <p>Statistics: The only valid statistic is Sum. Note that this represents the average not the sum.</p> <p>Dimensions</p> <ul style="list-style-type: none"> • TargetGroup • TargetGroup, LoadBalancer
RuleEvaluations	<p>The number of rules processed by the load balancer given a request rate averaged over an hour.</p> <p>Reporting criteria: There is a nonzero value</p> <p>Statistics: The most useful statistic is Sum.</p> <p>Dimensions</p> <ul style="list-style-type: none"> • LoadBalancer

Metric Dimensions for Application Load Balancers

To filter the metrics for your Application Load Balancer, use the following dimensions.

Dimension	Description
AvailabilityZone	Filter the metric data by Availability Zone.

Dimension	Description
LoadBalancer	Filter the metric data by load balancer. Specify the load balancer as follows: <code>app/load-balancer-name/1234567890123456</code> (the final portion of the load balancer ARN).
TargetGroup	Filter the metric data by target group. Specify the target group as follows: <code>targetgroup/target-group-name/1234567890123456</code> (the final portion of the target group ARN).

Network Load Balancer Metrics

The `AWS/NetworkELB` namespace includes the following metrics.

Metric	Description
ActiveFlowCount	<p>The total number of concurrent TCP flows (or connections) from clients to targets. This metric includes connections in the <code>SYN_SENT</code> and <code>ESTABLISHED</code> states. TCP connections are not terminated at the load balancer, so a client opening a TCP connection to a target counts as a single flow.</p> <p>Statistics: The most useful statistics are <code>Average</code>, <code>Maximum</code>, and <code>Minimum</code>.</p>
ConsumedLCUs	<p>The number of load balancer capacity units (LCU) used by your load balancer. You pay for the number of LCUs that you use per hour. For more information, see Elastic Load Balancing Pricing.</p>
HealthyHostCount	<p>The number of targets that are considered healthy.</p> <p>Statistics: The most useful statistics are <code>Average</code>, <code>Maximum</code>, and <code>Minimum</code>.</p>
NewFlowCount	<p>The total number of new TCP flows (or connections) established from clients to targets in the time period.</p> <p>Statistics: The most useful statistic is <code>Sum</code>.</p>
ProcessedBytes	<p>The total number of bytes processed by the load balancer, including TCP/IP headers.</p> <p>Statistics: The most useful statistic is <code>Sum</code>.</p>
TCP_Client_Reset_Count	<p>The total number of reset (RST) packets sent from a client to a target. These resets are generated by the client and forwarded by the load balancer.</p> <p>Statistics: The most useful statistic is <code>Sum</code>.</p>
TCP_ELB_Reset_Count	<p>The total number of reset (RST) packets generated by the load balancer.</p> <p>Statistics: The most useful statistic is <code>Sum</code>.</p>
TCP_Target_Reset_Count	<p>The total number of reset (RST) packets sent from a target to a client. These resets are generated by the target and forwarded by the load balancer.</p>

Metric	Description
	Statistics: The most useful statistic is <code>Sum</code> .
<code>UnHealthyHostCount</code>	The number of targets that are considered unhealthy. Statistics: The most useful statistics are <code>Average</code> , <code>Maximum</code> , and <code>Minimum</code> .

Metric Dimensions for Network Load Balancers

To filter the metrics for your load balancer, use the following dimensions.

Dimension	Description
<code>AvailabilityZone</code>	Filter the metric data by Availability Zone.
<code>LoadBalancer</code>	Filter the metric data by load balancer. Specify the load balancer as follows: <code>net/load-balancer-name/1234567890123456</code> (the final portion of the load balancer ARN).
<code>TargetGroup</code>	Filter the metric data by target group. Specify the target group as follows: <code>targetgroup/target-group-name/1234567890123456</code> (the final portion of the target group ARN).

Classic Load Balancer Metrics

The `AWS/ELB` namespace includes the following metrics.

Metric	Description
<code>BackendConnectionErrors</code>	The number of connections that were not successfully established between the load balancer and the registered instances. Because the load balancer retries the connection when there are errors, this count can exceed the request rate. Note that this count also includes any connection errors related to health checks. Reporting criteria: There is a nonzero value Statistics: The most useful statistic is <code>Sum</code> . Note that <code>Average</code> , <code>Minimum</code> , and <code>Maximum</code> are reported per load balancer node and are not typically useful. However, the difference between the minimum and maximum (or peak to average or average to trough) might be useful to determine whether a load balancer node is an outlier. Example: Suppose that your load balancer has 2 instances in <code>us-west-2a</code> and 2 instances in <code>us-west-2b</code> , and that attempts to connect to 1 instance in <code>us-west-2a</code> result in back-end connection errors. The sum for <code>us-west-2a</code> includes these connection errors, while the sum for <code>us-west-2b</code> does not include them. Therefore, the sum for the load balancer equals the sum for <code>us-west-2a</code> .
<code>HealthyHostCount</code>	The number of healthy instances registered with your load balancer. A newly registered instance is considered healthy after it passes the first

Metric	Description
	<p>health check. If cross-zone load balancing is enabled, the number of healthy instances for the <code>LoadBalancerName</code> dimension is calculated across all Availability Zones. Otherwise, it is calculated per Availability Zone.</p> <p>Reporting criteria: There are registered instances</p> <p>Statistics: The most useful statistics are <code>Average</code> and <code>Maximum</code>. These statistics are determined by the load balancer nodes. Note that some load balancer nodes might determine that an instance is unhealthy for a brief period while other nodes determine that it is healthy.</p> <p>Example: Suppose that your load balancer has 2 instances in us-west-2a and 2 instances in us-west-2b, us-west-2a has 1 unhealthy instance, and us-west-2b has no unhealthy instances. With the <code>AvailabilityZone</code> dimension, there is an average of 1 healthy and 1 unhealthy instance in us-west-2a, and an average of 2 healthy and 0 unhealthy instances in us-west-2b.</p>
<p><code>HTTPCode_Backend_2XX</code>, <code>HTTPCode_Backend_3XX</code>, <code>HTTPCode_Backend_4XX</code>, <code>HTTPCode_Backend_5XX</code></p>	<p>[HTTP listener] The number of HTTP response codes generated by registered instances. This count does not include any response codes generated by the load balancer.</p> <p>Reporting criteria: There is a nonzero value</p> <p>Statistics: The most useful statistic is <code>Sum</code>. Note that <code>Minimum</code>, <code>Maximum</code>, and <code>Average</code> are all 1.</p> <p>Example: Suppose that your load balancer has 2 instances in us-west-2a and 2 instances in us-west-2b, and that requests sent to 1 instance in us-west-2a result in HTTP 500 responses. The sum for us-west-2a includes these error responses, while the sum for us-west-2b does not include them. Therefore, the sum for the load balancer equals the sum for us-west-2a.</p>
<p><code>HTTPCode_ELB_4XX</code></p>	<p>[HTTP listener] The number of HTTP 4XX client error codes generated by the load balancer. Client errors are generated when a request is malformed or incomplete.</p> <p>Reporting criteria: There is a nonzero value</p> <p>Statistics: The most useful statistic is <code>Sum</code>. Note that <code>Minimum</code>, <code>Maximum</code>, and <code>Average</code> are all 1.</p> <p>Example: Suppose that your load balancer has us-west-2a and us-west-2b enabled, and that client requests include a malformed request URL. As a result, client errors would likely increase in all Availability Zones. The sum for the load balancer is the sum of the values for the Availability Zones.</p>

Metric	Description
HTTPCode_ELB_5XX	<p>[HTTP listener] The number of HTTP 5XX server error codes generated by the load balancer. This count does not include any response codes generated by the registered instances. The metric is reported if there are no healthy instances registered to the load balancer, or if the request rate exceeds the capacity of the instances (spillover) or the load balancer.</p> <p>Reporting criteria: There is a nonzero value</p> <p>Statistics: The most useful statistic is Sum. Note that Minimum, Maximum, and Average are all 1.</p> <p>Example: Suppose that your load balancer has us-west-2a and us-west-2b enabled, and that instances in us-west-2a are experiencing high latency and are slow to respond to requests. As a result, the surge queue for the load balancer nodes in us-west-2a fills and clients receive a 503 error. If us-west-2b continues to respond normally, the sum for the load balancer equals the sum for us-west-2a.</p>
Latency	<p>[HTTP listener] The total time elapsed, in seconds, from the time the load balancer sent the request to a registered instance until the instance started to send the response headers.</p> <p>[TCP listener] The total time elapsed, in seconds, for the load balancer to successfully establish a connection to a registered instance.</p> <p>Reporting criteria: There is a nonzero value</p> <p>Statistics: The most useful statistic is Average. Use Maximum to determine whether some requests are taking substantially longer than the average. Note that Minimum is typically not useful.</p> <p>Example: Suppose that your load balancer has 2 instances in us-west-2a and 2 instances in us-west-2b, and that requests sent to 1 instance in us-west-2a have a higher latency. The average for us-west-2a has a higher value than the average for us-west-2b.</p>

Metric	Description
RequestCount	<p>The number of requests completed or connections made during the specified interval (1 or 5 minutes).</p> <p>[HTTP listener] The number of requests received and routed, including HTTP error responses from the registered instances.</p> <p>[TCP listener] The number of connections made to the registered instances.</p> <p>Reporting criteria: There is a nonzero value</p> <p>Statistics: The most useful statistic is Sum. Note that Minimum, Maximum, and Average all return 1.</p> <p>Example: Suppose that your load balancer has 2 instances in us-west-2a and 2 instances in us-west-2b, and that 100 requests are sent to the load balancer. There are 60 requests sent to us-west-2a, with each instance receiving 30 requests, and 40 requests sent to us-west-2b, with each instance receiving 20 requests. With the AvailabilityZone dimension, there is a sum of 60 requests in us-west-2a and 40 requests in us-west-2b. With the LoadBalancerName dimension, there is a sum of 100 requests.</p>
SpilloverCount	<p>The total number of requests that were rejected because the surge queue is full.</p> <p>[HTTP listener] The load balancer returns an HTTP 503 error code.</p> <p>[TCP listener] The load balancer closes the connection.</p> <p>Reporting criteria: There is a nonzero value</p> <p>Statistics: The most useful statistic is Sum. Note that Average, Minimum, and Maximum are reported per load balancer node and are not typically useful.</p> <p>Example: Suppose that your load balancer has us-west-2a and us-west-2b enabled, and that instances in us-west-2a are experiencing high latency and are slow to respond to requests. As a result, the surge queue for the load balancer node in us-west-2a fills, resulting in spillover. If us-west-2b continues to respond normally, the sum for the load balancer will be the same as the sum for us-west-2a.</p>

Metric	Description
SurgeQueueLength	<p>The total number of requests that are pending routing. The load balancer queues a request if it is unable to establish a connection with a healthy instance in order to route the request. The maximum size of the queue is 1,024. Additional requests are rejected when the queue is full. For more information, see <code>SpilloverCount</code>.</p> <p>Reporting criteria: There is a nonzero value.</p> <p>Statistics: The most useful statistic is <code>Maximum</code>, because it represents the peak of queued requests. The <code>Average</code> statistic can be useful in combination with <code>Minimum</code> and <code>Maximum</code> to determine the range of queued requests. Note that <code>Sum</code> is not useful.</p> <p>Example: Suppose that your load balancer has <code>us-west-2a</code> and <code>us-west-2b</code> enabled, and that instances in <code>us-west-2a</code> are experiencing high latency and are slow to respond to requests. As a result, the surge queue for the load balancer nodes in <code>us-west-2a</code> fills, with clients likely experiencing increased response times. If this continues, the load balancer will likely have spillovers (see the <code>SpilloverCount</code> metric). If <code>us-west-2b</code> continues to respond normally, the <code>max</code> for the load balancer will be the same as the <code>max</code> for <code>us-west-2a</code>.</p>
UnHealthyHostCount	<p>The number of unhealthy instances registered with your load balancer. An instance is considered unhealthy after it exceeds the unhealthy threshold configured for health checks. An unhealthy instance is considered healthy again after it meets the healthy threshold configured for health checks.</p> <p>Reporting criteria: There are registered instances</p> <p>Statistics: The most useful statistics are <code>Average</code> and <code>Minimum</code>. These statistics are determined by the load balancer nodes. Note that some load balancer nodes might determine that an instance is unhealthy for a brief period while other nodes determine that it is healthy.</p> <p>Example: See <code>HealthyHostCount</code>.</p>

The following metrics enable you to estimate your costs if you migrate a Classic Load Balancer to an Application Load Balancer. These metrics are intended for informational use only, not for use with CloudWatch alarms. Note that if your Classic Load Balancer has multiple listeners, these metrics are aggregated across the listeners.

These estimates are based on a load balancer with one default rule and a certificate that is 2K in size. If you use a certificate that is 4K or greater in size, we recommend that you estimate your costs as follows: create an Application Load Balancer based on your Classic Load Balancer using the migration tool and monitor the `ConsumedLCUs` metric for the Application Load Balancer. For more information, see [Migrate from a Classic Load Balancer to an Application Load Balancer](#) in the *Elastic Load Balancing User Guide*.

Metric	Description
EstimatedALBActiveConnections	The estimated number of concurrent TCP connections active from clients to the load balancer and from the load balancer to targets.
EstimatedALBConsumedLCUs	The estimated number of load balancer capacity units (LCU) used by an Application Load Balancer. You pay for the number of LCUs that

Metric	Description
	you use per hour. For more information, see Elastic Load Balancing Pricing .
EstimatedALBNewConnections	The estimated number of new TCP connections established from clients to the load balancer and from the load balancer to targets.
EstimatedProcessedBytes	The estimated number of bytes processed by an Application Load Balancer.

Metric Dimensions for Classic Load Balancers

To filter the metrics for your Classic Load Balancer, use the following dimensions.

Dimension	Description
AvailabilityZone	Filter the metric data by the specified Availability Zone.
LoadBalancerName	Filter the metric data by the specified load balancer.

Amazon EMR Metrics and Dimensions

Amazon EMR (Amazon EMR) sends metrics to CloudWatch. All Amazon EMR job flows automatically send metrics in five-minute intervals. Metrics are archived for 15 months; after that period, the data is discarded. For more information, see [Monitor Metrics with Amazon CloudWatch](#) in the *Amazon EMR Developer Guide*.

Amazon EMR Metrics

Amazon EMR sends the following metrics to Amazon CloudWatch.

The AWS/ElasticMapReduce namespace includes the following metrics.

Note

Amazon EMR pulls metrics from a cluster. If a cluster becomes unreachable, no metrics are reported until the cluster becomes available again.

The following are Hadoop 1 metrics:

Metric	Description
<i>Cluster Status</i>	
IsIdle	<p>Indicates that a cluster is no longer performing work, but is still alive and accruing charges. It is set to 1 if no tasks are running and no jobs are running, and set to 0 otherwise. This value is checked at five-minute intervals and a value of 1 indicates only that the cluster was idle when checked, not that it was idle for the entire five minutes. To avoid false positives, you should raise an alarm when this value has been 1 for more than one consecutive 5-minute check. For example, you might raise an alarm on this value if it has been 1 for thirty minutes or longer.</p> <p>Use case: Monitor cluster performance</p>

Metric	Description
	Units: <i>Boolean</i>
JobsRunning	The number of jobs in the cluster that are currently running. Use case: Monitor cluster health Units: <i>Count</i>
JobsFailed	The number of jobs in the cluster that have failed. Use case: Monitor cluster health Units: <i>Count</i>
<i>Map/Reduce</i>	
MapTasksRunning	The number of running map tasks for each job. If you have a scheduler installed and multiple jobs running, multiple graphs are generated. Use case: Monitor cluster progress Units: <i>Count</i>
MapTasksRemaining	The number of remaining map tasks for each job. If you have a scheduler installed and multiple jobs running, multiple graphs are generated. A remaining map task is one that is not in any of the following states: Running, Killed, or Completed. Use case: Monitor cluster progress Units: <i>Count</i>
MapSlotsOpen	The unused map task capacity. This is calculated as the maximum number of map tasks for a given cluster, less the total number of map tasks currently running in that cluster. Use case: Analyze cluster performance Units: <i>Count</i>
RemainingMapTasksPerSlot	The ratio of the total map tasks remaining to the total map slots available in the cluster. Use case: Analyze cluster performance Units: <i>Ratio</i>
ReduceTasksRunning	The number of running reduce tasks for each job. If you have a scheduler installed and multiple jobs running, multiple graphs are generated. Use case: Monitor cluster progress Units: <i>Count</i>

Metric	Description
ReduceTasksRemaining	<p>The number of remaining reduce tasks for each job. If you have a scheduler installed and multiple jobs running, multiple graphs are generated.</p> <p>Use case: Monitor cluster progress</p> <p>Units: <i>Count</i></p>
ReduceSlotsOpen	<p>Unused reduce task capacity. This is calculated as the maximum reduce task capacity for a given cluster, less the number of reduce tasks currently running in that cluster.</p> <p>Use case: Analyze cluster performance</p> <p>Units: <i>Count</i></p>
<i>Node Status</i>	
CoreNodesRunning	<p>The number of core nodes working. Data points for this metric are reported only when a corresponding instance group exists.</p> <p>Use case: Monitor cluster health</p> <p>Units: <i>Count</i></p>
CoreNodesPending	<p>The number of core nodes waiting to be assigned. All of the core nodes requested may not be immediately available; this metric reports the pending requests. Data points for this metric are reported only when a corresponding instance group exists.</p> <p>Use case: Monitor cluster health</p> <p>Units: <i>Count</i></p>
LiveDataNodes	<p>The percentage of data nodes that are receiving work from Hadoop.</p> <p>Use case: Monitor cluster health</p> <p>Units: <i>Percent</i></p>
TaskNodesRunning	<p>The number of task nodes working. Data points for this metric are reported only when a corresponding instance group exists.</p> <p>Use case: Monitor cluster health</p> <p>Units: <i>Count</i></p>
TaskNodesPending	<p>The number of core nodes waiting to be assigned. All of the task nodes requested may not be immediately available; this metric reports the pending requests. Data points for this metric are reported only when a corresponding instance group exists.</p> <p>Use case: Monitor cluster health</p> <p>Units: <i>Count</i></p>

Metric	Description
LiveTaskTrackers	<p>The percentage of task trackers that are functional.</p> <p>Use case: Monitor cluster health</p> <p>Units: <i>Percent</i></p>
<i>IO</i>	
S3BytesWritten	<p>The number of bytes written to Amazon S3. This metric aggregates MapReduce jobs only, and does not apply for other workloads on EMR.</p> <p>Use case: Analyze cluster performance, Monitor cluster progress</p> <p>Units: <i>Count</i></p>
S3BytesRead	<p>The number of bytes read from Amazon S3. This metric aggregates MapReduce jobs only, and does not apply for other workloads on EMR.</p> <p>Use case: Analyze cluster performance, Monitor cluster progress</p> <p>Units: <i>Count</i></p>
HDFSUtilization	<p>The percentage of HDFS storage currently used.</p> <p>Use case: Analyze cluster performance</p> <p>Units: <i>Percent</i></p>
HDFSBytesRead	<p>The number of bytes read from HDFS.</p> <p>Use case: Analyze cluster performance, Monitor cluster progress</p> <p>Units: <i>Bytes</i></p>
HDFSBytesWritten	<p>The number of bytes written to HDFS.</p> <p>Use case: Analyze cluster performance, Monitor cluster progress</p> <p>Units: <i>Bytes</i></p>
MissingBlocks	<p>The number of blocks in which HDFS has no replicas. These might be corrupt blocks.</p> <p>Use case: Monitor cluster health</p> <p>Units: <i>Count</i></p>

Metric	Description
TotalLoad	<p>The current, total number of readers and writers reported by all DataNodes in a cluster.</p> <p>Use case: Diagnose the degree to which high I/O might be contributing to poor job execution performance. Worker nodes running the DataNode daemon must also perform map and reduce tasks. Persistently high TotalLoad values over time can indicate that high I/O might be a contributing factor to poor performance. Occasional spikes in this value are typical and do not usually indicate a problem.</p> <p>Units: <i>Count</i></p>
<i>HBase</i>	
BackupFailed	<p>Whether the last backup failed. This is set to 0 by default and updated to 1 if the previous backup attempt failed. This metric is only reported for HBase clusters.</p> <p>Use case: Monitor HBase backups</p> <p>Units: <i>Count</i></p>
MostRecentBackupDuration	<p>The amount of time it took the previous backup to complete. This metric is set regardless of whether the last completed backup succeeded or failed. While the backup is ongoing, this metric returns the number of minutes after the backup started. This metric is only reported for HBase clusters.</p> <p>Use case: Monitor HBase Backups</p> <p>Units: <i>Minutes</i></p>
TimeSinceLastSuccessfulBackup	<p>The number of elapsed minutes after the last successful HBase backup started on your cluster. This metric is only reported for HBase clusters.</p> <p>Use case: Monitor HBase backups</p> <p>Units: <i>Minutes</i></p>

The following metrics are available for Hadoop 2 AMIs:

Metric	Description
<i>Cluster Status</i>	
IsIdle	<p>Indicates that a cluster is no longer performing work, but is still alive and accruing charges. It is set to 1 if no tasks are running and no jobs are running, and set to 0 otherwise. This value is checked at five-minute intervals and a value of 1 indicates only that the cluster was idle when checked, not that it was idle for the entire five minutes. To avoid false positives, you should raise an alarm when this value has been 1 for more than one consecutive 5-minute check. For example, you might raise an alarm on this value if it has been 1 for thirty minutes or longer.</p>

Metric	Description
	<p>Use case: Monitor cluster performance</p> <p>Units: <i>Boolean</i></p>
ContainerAllocated	<p>The number of resource containers allocated by the ResourceManager.</p> <p>Use case: Monitor cluster progress</p> <p>Units: <i>Count</i></p>
ContainerReserved	<p>The number of containers reserved.</p> <p>Use case: Monitor cluster progress</p> <p>Units: <i>Count</i></p>
ContainerPending	<p>The number of containers in the queue that have not yet been allocated.</p> <p>Use case: Monitor cluster progress</p> <p>Units: <i>Count</i></p>
ContainerPendingRatio	<p>The ratio of pending containers to containers allocated ($\text{ContainerPendingRatio} = \text{ContainerPending} / \text{ContainerAllocated}$). If $\text{ContainerAllocated} = 0$, then $\text{ContainerPendingRatio} = \text{ContainerPending}$. The value of ContainerPendingRatio represents a number, not a percentage. This value is useful for scaling cluster resources based on container allocation behavior.</p> <p>Units: <i>Count</i></p>
AppsCompleted	<p>The number of applications submitted to YARN that have completed.</p> <p>Use case: Monitor cluster progress</p> <p>Units: <i>Count</i></p>
AppsFailed	<p>The number of applications submitted to YARN that have failed to complete.</p> <p>Use case: Monitor cluster progress, Monitor cluster health</p> <p>Units: <i>Count</i></p>
AppsKilled	<p>The number of applications submitted to YARN that have been killed.</p> <p>Use case: Monitor cluster progress, Monitor cluster health</p> <p>Units: <i>Count</i></p>

Metric	Description
AppsPending	<p>The number of applications submitted to YARN that are in a pending state.</p> <p>Use case: Monitor cluster progress</p> <p>Units: <i>Count</i></p>
AppsRunning	<p>The number of applications submitted to YARN that are running.</p> <p>Use case: Monitor cluster progress</p> <p>Units: <i>Count</i></p>
AppsSubmitted	<p>The number of applications submitted to YARN.</p> <p>Use case: Monitor cluster progress</p> <p>Units: <i>Count</i></p>
<i>Node Status</i>	
CoreNodesRunning	<p>The number of core nodes working. Data points for this metric are reported only when a corresponding instance group exists.</p> <p>Use case: Monitor cluster health</p> <p>Units: <i>Count</i></p>
CoreNodesPending	<p>The number of core nodes waiting to be assigned. All of the core nodes requested may not be immediately available; this metric reports the pending requests. Data points for this metric are reported only when a corresponding instance group exists.</p> <p>Use case: Monitor cluster health</p> <p>Units: <i>Count</i></p>
LiveDataNodes	<p>The percentage of data nodes that are receiving work from Hadoop.</p> <p>Use case: Monitor cluster health</p> <p>Units: <i>Percent</i></p>
MRTotalNodes	<p>The number of nodes presently available to MapReduce jobs. Equivalent to YARN metric <code>mapred.resourcemanager.TotalNodes</code>.</p> <p>Use ase: Monitor cluster progress</p> <p>Units: <i>Count</i></p>

Metric	Description
MRActiveNodes	<p>The number of nodes presently running MapReduce tasks or jobs. Equivalent to YARN metric <code>mapred.resourcemanager.NoOfActiveNodes</code>.</p> <p>Use case: Monitor cluster progress</p> <p>Units: <i>Count</i></p>
MRLostNodes	<p>The number of nodes allocated to MapReduce that have been marked in a LOST state. Equivalent to YARN metric <code>mapred.resourcemanager.NoOfLostNodes</code>.</p> <p>Use case: Monitor cluster health, Monitor cluster progress</p> <p>Units: <i>Count</i></p>
MRUnhealthyNodes	<p>The number of nodes available to MapReduce jobs marked in an UNHEALTHY state. Equivalent to YARN metric <code>mapred.resourcemanager.NoOfUnhealthyNodes</code>.</p> <p>Use case: Monitor cluster progress</p> <p>Units: <i>Count</i></p>
MRDecommissionedNodes	<p>The number of nodes allocated to MapReduce applications that have been marked in a DECOMMISSIONED state. Equivalent to YARN metric <code>mapred.resourcemanager.NoOfDecommissionedNodes</code>.</p> <p>Use case: Monitor cluster health, Monitor cluster progress</p> <p>Units: <i>Count</i></p>
MRRebootedNodes	<p>The number of nodes available to MapReduce that have been rebooted and marked in a REBOOTED state. Equivalent to YARN metric <code>mapred.resourcemanager.NoOfRebootedNodes</code>.</p> <p>Use case: Monitor cluster health, Monitor cluster progress</p> <p>Units: <i>Count</i></p>
<i>IO</i>	
S3BytesWritten	<p>The number of bytes written to Amazon S3.</p> <p>Use case: Analyze cluster performance, Monitor cluster progress</p> <p>Units: <i>Count</i></p>
S3BytesRead	<p>The number of bytes read from Amazon S3.</p> <p>Use case: Analyze cluster performance, Monitor cluster progress</p> <p>Units: <i>Count</i></p>

Metric	Description
HDFSUtilization	<p>The percentage of HDFS storage currently used.</p> <p>Use case: Analyze cluster performance</p> <p>Units: <i>Percent</i></p>
HDFSBytesRead	<p>The number of bytes read from HDFS. This metric aggregates MapReduce jobs only, and does not apply for other workloads on EMR.</p> <p>Use case: Analyze cluster performance, Monitor cluster progress</p> <p>Units: <i>Count</i></p>
HDFSBytesWritten	<p>The number of bytes written to HDFS. This metric aggregates MapReduce jobs only, and does not apply for other workloads on EMR.</p> <p>Use case: Analyze cluster performance, Monitor cluster progress</p> <p>Units: <i>Count</i></p>
MissingBlocks	<p>The number of blocks in which HDFS has no replicas. These might be corrupt blocks.</p> <p>Use case: Monitor cluster health</p> <p>Units: <i>Count</i></p>
CorruptBlocks	<p>The number of blocks that HDFS reports as corrupted.</p> <p>Use case: Monitor cluster health</p> <p>Units: <i>Count</i></p>
TotalLoad	<p>The total number of concurrent data transfers.</p> <p>Use case: Monitor cluster health</p> <p>Units: <i>Count</i></p>
MemoryTotalMB	<p>The total amount of memory in the cluster.</p> <p>Use case: Monitor cluster progress</p> <p>Units: <i>Bytes</i></p>
MemoryReservedMB	<p>The amount of memory reserved.</p> <p>Use case: Monitor cluster progress</p> <p>Units: <i>Bytes</i></p>

Metric	Description
MemoryAvailableMB	<p>The amount of memory available to be allocated.</p> <p>Use case: Monitor cluster progress</p> <p>Units: <i>Bytes</i></p>
YARNMemoryAvailablePercentage	<p>The percentage of remaining memory available to YARN ($\text{YARNMemoryAvailablePercentage} = \text{MemoryAvailableMB} / \text{MemoryTotalMB}$). This value is useful for scaling cluster resources based on YARN memory usage.</p>
MemoryAllocatedMB	<p>The amount of memory allocated to the cluster.</p> <p>Use case: Monitor cluster progress</p> <p>Units: <i>Bytes</i></p>
PendingDeletionBlocks	<p>The number of blocks marked for deletion.</p> <p>Use case: Monitor cluster progress, Monitor cluster health</p> <p>Units: <i>Count</i></p>
UnderReplicatedBlocks	<p>The number of blocks that need to be replicated one or more times.</p> <p>Use case: Monitor cluster progress, Monitor cluster health</p> <p>Units: <i>Count</i></p>
DfsPendingReplicationBlocks	<p>The status of block replication: blocks being replicated, age of replication requests, and unsuccessful replication requests.</p> <p>Use case: Monitor cluster progress, Monitor cluster health</p> <p>Units: <i>Count</i></p>
CapacityRemainingGB	<p>The amount of remaining HDFS disk capacity.</p> <p>Use case: Monitor cluster progress, Monitor cluster health</p> <p>Units: <i>Bytes</i></p>
<i>HBase</i>	
HbaseBackupFailed	<p>Whether the last backup failed. This is set to 0 by default and updated to 1 if the previous backup attempt failed. This metric is only reported for HBase clusters.</p> <p>Use case: Monitor HBase backups</p> <p>Units: <i>Count</i></p>

Metric	Description
MostRecentBackupDuration	<p>The amount of time it took the previous backup to complete. This metric is set regardless of whether the last completed backup succeeded or failed. While the backup is ongoing, this metric returns the number of minutes after the backup started. This metric is only reported for HBase clusters.</p> <p>Use case: Monitor HBase Backups</p> <p>Units: <i>Minutes</i></p>
TimeSinceLastSuccessfulBackup	<p>The number of elapsed minutes after the last successful HBase backup started on your cluster. This metric is only reported for HBase clusters.</p> <p>Use case: Monitor HBase backups</p> <p>Units: <i>Minutes</i></p>

Amazon EMR Dimensions

The following dimensions are available for Amazon EMR.

Dimension	Description
JobFlowId	The same as cluster ID, which is the unique identifier of a cluster in the form j-xxxxxxxxxxxxxx. Find this value by clicking on the cluster in the Amazon EMR console.
JobId	The identifier of a job within a cluster. You can use this to filter the metrics returned from a cluster down to those that apply to a single job within the cluster. JobId takes the form job_XXXXXXXXXXXX_XXXX.

Amazon Elasticsearch Service Metrics and Dimensions

Amazon Elasticsearch Service sends data to CloudWatch every minute. You can create alarms using [Amazon Elasticsearch Service Metrics and Dimensions \(p. 179\)](#). For more information, see [Monitoring Cluster Metrics and Statistics with Amazon CloudWatch](#) in the *Amazon Elasticsearch Service Developer Guide*.

Amazon Elasticsearch Service Metrics

The AWS/ES namespace includes the following metrics for clusters.

Metric	Description
ClusterStatus.green	<p>Indicates that all index shards are allocated to nodes in the cluster.</p> <p>Relevant statistics: Minimum, Maximum</p>

Metric	Description
<code>ClusterStatus.yellow</code>	<p>Indicates that the primary shards for all indices are allocated to nodes in a cluster, but the replica shards for at least one index are not. Single node clusters always initialize with this cluster status because there is no second node to which a replica can be assigned. You can either increase your node count to obtain a green cluster status, or you can use the Elasticsearch API to set the <code>number_of_replicas</code> setting for your index to 0. For more information, see Configuring Amazon Elasticsearch Service Domains and Update Indices Settings in the Elasticsearch documentation.</p> <p>Relevant statistics: Minimum, Maximum</p>
<code>ClusterStatus.red</code>	<p>Indicates that the primary and replica shards of at least one index are not allocated to nodes in a cluster. To recover, you must delete the indices or restore a snapshot and then add EBS-based storage, use larger instance types, or add instances. For more information, see Red Cluster Status.</p> <p>Relevant statistics: Minimum, Maximum</p>
<code>Nodes</code>	<p>The number of nodes in the Amazon ES cluster.</p> <p>Relevant Statistics: Minimum, Maximum, Average</p>
<code>SearchableDocuments</code>	<p>The total number of searchable documents across all indices in the cluster.</p> <p>Relevant statistics: Minimum, Maximum, Average</p>
<code>DeletedDocuments</code>	<p>The total number of deleted documents across all indices in the cluster.</p> <p>Relevant statistics: Minimum, Maximum, Average</p>
<code>CPUUtilization</code>	<p>The maximum percentage of CPU resources used for data nodes in the cluster.</p> <p>Relevant statistics: Maximum, Average</p>
<code>FreeStorageSpace</code>	<p>The free space, in megabytes, for all data nodes in the cluster. Amazon ES throws a <code>ClusterBlockException</code> when this metric reaches 0. To recover, you must either delete indices, add larger instances, or add EBS-based storage to existing instances. To learn more, see Recovering from a Lack of Free Storage Space</p> <p>Note <code>FreeStorageSpace</code> will always be lower than the value that the <code>Elasticsearch _cluster/stats</code> API provides. Amazon ES reserves a percentage of the storage space on each instance for internal operations.</p> <p>Relevant statistics: Minimum</p>
<code>ClusterUsedSpace</code>	<p>The total used space, in megabytes, for a cluster. You can view this metric in the Amazon CloudWatch console, but not in the Amazon ES console.</p> <p>Relevant statistics: Minimum, Maximum</p>

Metric	Description
ClusterIndexWritesBlocked	<p>Indicates whether your cluster is accepting or blocking incoming write requests. A value of 0 means that the cluster is accepting requests. A value of 1 means that it is blocking requests.</p> <p>Many factors can cause a cluster to begin blocking requests. Some common factors include the following: <code>FreeStorageSpace</code> is too low, <code>JVMMemoryPressure</code> is too high, or <code>CPUUtilization</code> is too high. To alleviate this issue, consider adding more disk space or scaling your cluster.</p> <p>Relevant statistics: Maximum</p> <p>Note You can view this metric in the Amazon CloudWatch console, but not the Amazon ES console.</p>
JVMMemoryPressure	<p>The maximum percentage of the Java heap used for all data nodes in the cluster.</p> <p>Relevant statistics: Maximum</p>
AutomatedSnapshotFailure	<p>The number of failed automated snapshots for the cluster. A value of 1 indicates that no automated snapshot was taken for the domain in the previous 36 hours.</p> <p>Relevant statistics: Minimum, Maximum</p>
CPUCreditBalance	<p>The remaining CPU credits available for data nodes in the cluster. A CPU credit provides the performance of a full CPU core for one minute. For more information, see CPU Credits in the <i>Amazon EC2 Developer Guide</i>. This metric is available only for the <code>t2.micro.elasticsearch</code>, <code>t2.small.elasticsearch</code>, and <code>t2.medium.elasticsearch</code> instance types.</p> <p>Relevant statistics: Minimum</p>
KibanaHealthyNodes	<p>A health check for Kibana. A value of 1 indicates normal behavior. A value of 0 indicates that Kibana is inaccessible. In most cases, the health of Kibana mirrors the health of the cluster.</p> <p>Relevant statistics: Minimum</p> <p>Note You can view this metric on the Amazon CloudWatch console, but not the Amazon ES console.</p>
KMSKeyError	<p>A value of 1 indicates that the KMS customer master key used to encrypt data at rest has been disabled. To restore the domain to normal operations, re-enable the key. The console displays this metric only for domains that encrypt data at rest..</p> <p>Relevant statistics: Minimum, Maximum</p>

Metric	Description
KMSKeyInaccessible	<p>A value of 1 indicates that the KMS customer master key used to encrypt data at rest has been deleted or revoked its grants to Amazon ES. You can't recover domains that are in this state. If you have a manual snapshot, though, you can use it to migrate the domain's data to a new domain. The console displays this metric only for domains that encrypt data at rest.</p> <p>Relevant statistics: Minimum, Maximum</p>

The AWS/ES namespace includes the following metrics for dedicated master nodes.

Metric	Description
MasterCPUUtilization	<p>The maximum percentage of CPU resources used by the dedicated master nodes. We recommend increasing the size of the instance type when this metric reaches 60 percent.</p> <p>Relevant statistics: Average</p>
MasterFreeStorageSpace	<p>This metric is not relevant and can be ignored. The service does not use master nodes as data nodes.</p>
MasterJVMMemoryPressure	<p>The maximum percentage of the Java heap used for all dedicated master nodes in the cluster. We recommend moving to a larger instance type when this metric reaches 85 percent.</p> <p>Relevant statistics: Maximum</p>
MasterCPUCreditBalance	<p>The remaining CPU credits available for dedicated master nodes in the cluster. A CPU credit provides the performance of a full CPU core for one minute. For more information, see CPU Credits in the <i>Amazon EC2 User Guide for Linux Instances</i>. This metric is available only for the t2.micro.elasticsearch, t2.small.elasticsearch, and t2.medium.elasticsearch instance types.</p> <p>Relevant statistics: Minimum</p>
MasterReachableFromNode	<p>A health check for MasterNotDiscovered exceptions. A value of 1 indicates normal behavior. A value of 0 indicates that <code>/_cluster/health/</code> is failing.</p> <p>Failures mean that the master node stopped or is not reachable. They are usually the result of a network connectivity issue or AWS dependency problem.</p> <p>Relevant statistics: Minimum</p> <p>Note You can view this metric on the Amazon CloudWatch console, but not the Amazon ES console.</p>

The AWS/ES namespace includes the following metrics for EBS volumes.

Metric	Description
ReadLatency	The latency, in seconds, for read operations on EBS volumes. Relevant statistics: Minimum, Maximum, Average
WriteLatency	The latency, in seconds, for write operations on EBS volumes. Relevant statistics: Minimum, Maximum, Average
ReadThroughput	The throughput, in bytes per second, for read operations on EBS volumes. Relevant statistics: Minimum, Maximum, Average
WriteThroughput	The throughput, in bytes per second, for write operations on EBS volumes. Relevant statistics: Minimum, Maximum, Average
DiskQueueDepth	The number of pending input and output (I/O) requests for an EBS volume. Relevant statistics: Minimum, Maximum, Average
ReadIOPS	The number of input and output (I/O) operations per second for read operations on EBS volumes. Relevant statistics: Minimum, Maximum, Average
WriteIOPS	The number of input and output (I/O) operations per second for write operations on EBS volumes. Relevant statistics: Minimum, Maximum, Average

Dimensions for Amazon Elasticsearch Service Metrics

To filter the metrics, use the following dimensions.

Dimension	Description
ClientId	The AWS account ID.
DomainName	The name of the search domain.

Amazon Elastic Transcoder Metrics and Dimensions

When you interact with Amazon Elastic Transcoder, it sends the following metrics to CloudWatch every minute.

Elastic Transcoder Metrics

The `AWS/ElasticTranscoder` namespace includes the following metrics.

Metric	Description
Billed HD Output	The number of billable seconds of HD output for a pipeline.

Metric	Description
	Valid Dimensions: PipelineId Unit: Seconds
Billed SD Output	The number of billable seconds of SD output for a pipeline. Valid Dimensions: PipelineId Unit: Seconds
Billed Audio Output	The number of billable seconds of audio output for a pipeline. Valid Dimensions: PipelineId Unit: Seconds
Jobs Completed	The number of jobs completed by this pipeline. Valid Dimensions: PipelineId Unit: Count
Jobs Errored	The number of jobs that failed because of invalid inputs, such as a request to transcode a file that is not in the given input bucket. Valid Dimensions: PipelineId Unit: Count
Outputs per Job	The number of outputs Elastic Transcoder created for a job. Valid Dimensions: PipelineId Unit: Count
Standby Time	The number of seconds before Elastic Transcoder started transcoding a job. Valid Dimensions: PipelineId Unit: Seconds
Errors	The number of errors caused by invalid operation parameters, such as a request for a job status that does not include the job ID. Valid Dimensions: Operation Unit: Count

Metric	Description
Throttles	The number of times that Elastic Transcoder automatically throttled an operation. Valid Dimensions: Operation Unit: Count

Dimensions for Elastic Transcoder Metrics

Elastic Transcoder metrics use the Elastic Transcoder namespace and provide metrics for the following dimension(s):

Dimension	Description
PipelineId	The ID of a pipeline. This dimension filters the data you request for an Elastic Transcoder pipeline.
Operation	This dimension filters the data you request for the APIs that Elastic Transcoder provides.

Amazon GameLift Metrics and Dimensions

Amazon GameLift Metrics for Fleets

The `AWS/GameLift` namespace includes the following metrics related to activity across a fleet or a group of fleets. The Amazon GameLift service sends metrics to CloudWatch every minute.

Instances

Metric	Description
ActiveInstances	Instances with <code>ACTIVE</code> status, which means they are running active server processes. The count includes idle instances and those that are hosting one or more game sessions. This metric measures current total instance capacity. This metric can be used with automatic scaling. Units: Count Relevant CloudWatch statistics: Average, Minimum, Maximum
DesiredInstances	Target number of active instances that Amazon GameLift is working to maintain in the fleet. With automatic scaling, this value is determined based on the scaling policies currently in force. Without automatic scaling, this value is set manually. This metric is not available when viewing data for fleet metric groups.

Metric	Description
	Units: Count Relevant CloudWatch statistics: Average, Minimum, Maximum
IdleInstances	Active instances that are currently hosting zero (0) game sessions. This metric measures capacity that is available but unused. This metric can be used with automatic scaling. Units: Count Relevant CloudWatch statistics: Average, Minimum, Maximum
MaxInstances	Maximum number of instances that are allowed for the fleet. A fleet's instance maximum determines the capacity ceiling during manual or automatic scaling up. This metric is not available when viewing data for fleet metric groups. Units: Count Relevant CloudWatch statistics: Average, Minimum, Maximum
MinInstances	Minimum number of instances allowed for the fleet. A fleet's instance minimum determines the capacity floor during manual or automatic scaling down. This metric is not available when viewing data for fleet metric groups. Units: Count Relevant CloudWatch statistics: Average, Minimum, Maximum
PercentIdleInstances	Percentage of all active instances that are idle (calculated as <code>IdleInstances / ActiveInstances</code>). This metric can be used for automatic scaling. Units: Percent Relevant CloudWatch statistics: Average, Minimum, Maximum
InstanceInterruptions	Number of spot instances that have been interrupted. Units: Count Relevant CloudWatch statistics: Sum, Average, Minimum, Maximum

Server Processes

Metric	Description
<code>ActiveServerProcesses</code>	<p>Server processes with ACTIVE status, which means they are running and able to host game sessions. The count includes idle server processes and those that are hosting game sessions. This metric measures current total server process capacity.</p> <p>Units: Count</p> <p>Relevant CloudWatch statistics: Average, Minimum, Maximum</p>
<code>HealthyServerProcesses</code>	<p>Active server processes that are reporting healthy. This metric is useful for tracking the overall health of the fleet's game servers.</p> <p>Units: Count</p> <p>Relevant CloudWatch statistics: Average, Minimum, Maximum</p>
<code>PercentHealthyServerProcesses</code>	<p>Percentage of all active server processes that are reporting healthy (calculated as <code>HealthyServerProcesses</code> / <code>ActiveServerProcesses</code>).</p> <p>Units: Percent</p> <p>Relevant CloudWatch statistics: Average, Minimum, Maximum</p>
<code>ServerProcessAbnormalTerminations</code>	<p>Server processes that were shut down due to abnormal circumstances since the last report. This metric includes terminations that were initiated by the Amazon GameLift service. This occurs when a server process stops responding, consistently reports failed health checks, or does not terminate cleanly (by calling ProcessEnding()).</p> <p>Units: Count</p> <p>Relevant CloudWatch statistics: Sum, Average, Minimum, Maximum</p>
<code>ServerProcessActivations</code>	<p>Server processes that successfully transitioned from ACTIVATING to ACTIVE status since the last report. Server processes cannot host game sessions until they are active.</p> <p>Units: Count</p> <p>Relevant CloudWatch statistics: Sum, Average, Minimum, Maximum</p>
<code>ServerProcessTerminations</code>	<p>Server processes that were shut down since the last report. This includes all server processes that</p>

Metric	Description
	<p>transitioned to TERMINATED status for any reason, including normal and abnormal process terminations.</p> <p>Units: Count</p> <p>Relevant CloudWatch statistics: Sum, Average, Minimum, Maximum</p>

Game Sessions

Metric	Description
<code>ActivatingGameSessions</code>	<p>Game sessions with ACTIVATING status, which means they are in the process of starting up. Game sessions cannot host players until they are active. High numbers for a sustained period of time may indicate that game sessions are not transitioning from ACTIVATING to ACTIVE status. This metric can be used with automatic scaling.</p> <p>Units: Count</p> <p>Relevant CloudWatch statistics: Average, Minimum, Maximum</p>
<code>ActiveGameSessions</code>	<p>Game sessions with ACTIVE status, which means they are able to host players, and are hosting zero or more players. This metric measures the total number of game sessions currently being hosted. This metric can be used with automatic scaling.</p> <p>Units: Count</p> <p>Relevant CloudWatch statistics: Average, Minimum, Maximum</p>
<code>AvailableGameSessions</code>	<p>Game session slots on active, healthy server processes that are not currently being used. This metric measures the number of new game sessions that could be started immediately. This metric can be used with automatic scaling.</p> <p>Units: Count</p> <p>Relevant CloudWatch statistics: Average, Minimum, Maximum</p>
<code>PercentAvailableGameSessions</code>	<p>Percentage of game session slots on all active server processes (healthy or unhealthy) that are not currently being used (calculated as $\text{AvailableGameSessions} / [\text{ActiveGameSessions} + \text{AvailableGameSessions} + \text{unhealthy server processes}]$). This metric can be used with automatic scaling.</p>

Metric	Description
	Units: Percent Relevant CloudWatch statistics: Average
GameSessionInterruptions	Number of game sessions on spot instances that have been interrupted. Units: Count Relevant CloudWatch statistics: Sum, Average, Minimum, Maximum

Player Sessions

Metric	Description
CurrentPlayerSessions	Player sessions with either ACTIVE status (player is connected to an active game session) or RESERVED status (player has been given a slot in a game session but hasn't yet connected). This metric can be used with automatic scaling. Units: Count Relevant CloudWatch statistics: Average, Minimum, Maximum
PlayerSessionActivations	Player sessions that transitioned from RESERVED status to ACTIVE since the last report. This occurs when a player successfully connects to an active game session. Units: Count Relevant CloudWatch statistics: Sum, Average, Minimum, Maximum

Amazon GameLift Metrics for Queues

The `GameLift` namespace includes the following metrics related to activity across a game session placement queue. The Amazon GameLift service sends metrics to CloudWatch every minute.

Metric	Description
AverageWaitTime	Average amount of time that game session placement requests in the queue with status PENDING have been waiting to be fulfilled. Units: Seconds Relevant CloudWatch statistics: Average, Minimum, Maximum

Metric	Description
<code>PlacementsCanceled</code>	<p>Game session placement requests that were canceled before timing out since the last report.</p> <p>Units: Count</p> <p>Relevant CloudWatch statistics: Average, Minimum, Maximum</p>
<code>PlacementsStarted</code>	<p>New game session placement requests that were added to the queue since the last report.</p> <p>Units: Count</p> <p>Relevant CloudWatch statistics: Average, Minimum, Maximum</p>
<code>PlacementsSucceeded</code>	<p>Game session placement requests that resulted in a new game session since the last report.</p> <p>Units: Count</p> <p>Relevant CloudWatch statistics: Average, Minimum, Maximum</p>
<code>PlacementsTimedOut</code>	<p>Game session placement requests that reached the queue's timeout limit without being fulfilled since the last report.</p> <p>Units: Count</p> <p>Relevant CloudWatch statistics: Average, Minimum, Maximum</p>
<code>QueueDepth</code>	<p>Number of game session placement requests in the queue with status PENDING.</p> <p>Units: Count</p> <p>Relevant CloudWatch statistics: Average, Minimum, Maximum</p>

Amazon GameLift Metrics for Matchmaking

The `GameLift` namespace includes the following metrics related to matchmaking activity. The Amazon GameLift service sends metrics to CloudWatch every minute.

For more information on the sequence of matchmaking activity, see [How Amazon GameLift FlexMatch Works](#).

Metric	Description
<code>CurrentTickets</code>	<p>Matchmaking requests currently being processed or waiting to be processed.</p> <p>Units: Count</p>

Metric	Description
	Relevant CloudWatch statistics: Average, Minimum, Maximum
MatchAcceptancesTimedOut	<p>For matchmaking configurations that require acceptance, the potential matches that timed out during acceptance since the last report.</p> <p>Units: Count</p> <p>Relevant CloudWatch statistics: Sum</p>
MatchesAccepted	<p>For matchmaking configurations that require acceptance, the potential matches that were accepted since the last report.</p> <p>Units: Count</p> <p>Relevant CloudWatch statistics: Sum</p>
MatchesCreated	<p>Potential matches that were created since the last report.</p> <p>Units: Count</p> <p>Relevant CloudWatch statistics: Sum</p>
MatchesPlaced	<p>Matches that were successfully placed into a game session since the last report.</p> <p>Units: Count</p> <p>Relevant CloudWatch statistics: Sum</p>
MatchesRejected	<p>For matchmaking configurations that require acceptance, the potential matches that were rejected by at least one player since the last report.</p> <p>Units: Count</p> <p>Relevant CloudWatch statistics: Sum</p>
PlayersStarted	<p>Players in matchmaking tickets that were added since the last report.</p> <p>Units: Count</p> <p>Relevant CloudWatch statistics: Sum</p>
RuleEvaluationsPassed	<p>Rule evaluations during the matchmaking process that passed since the last report. This metric is limited to the top 50 rules.</p> <p>Units: Count</p> <p>Relevant CloudWatch statistics: Sum</p>

Metric	Description
RuleEvaluationsFailed	<p>Rule evaluations during matchmaking that failed since the last report. This metric is limited to the top 50 rules.</p> <p>Units: Count</p> <p>Relevant CloudWatch statistics: Sum</p>
TicketsFailed	<p>Matchmaking requests that resulted in failure since the last report.</p> <p>Units: Count</p> <p>Relevant CloudWatch statistics: Sum</p>
TicketsStarted	<p>New matchmaking requests that were created since the last report.</p> <p>Units: Count</p> <p>Relevant CloudWatch statistics: Sum</p>
TicketsTimedOut	<p>Matchmaking requests that reached the timeout limit since the last report.</p> <p>Units: Count</p> <p>Relevant CloudWatch statistics: Sum</p>
TimeToMatch	<p>For matchmaking requests that were put into a potential match before the last report, the amount of time between ticket creation and potential match creation.</p> <p>Units: Seconds</p> <p>Relevant CloudWatch statistics: Data Samples, Average, Minimum, Maximum, p99</p>
TimeToTicketCancel	<p>For matchmaking requests that were canceled before the last report, the amount of time between ticket creation and cancellation.</p> <p>Units: Seconds</p> <p>Relevant CloudWatch statistics: Data Samples, Average, Minimum, Maximum, p99</p>
TimeToTicketSuccess	<p>For matchmaking requests that succeeded before the last report, the amount of time between ticket creation and successful match placement.</p> <p>Units: Seconds</p> <p>Relevant CloudWatch statistics: Data Samples, Average, Minimum, Maximum, p99</p>

Dimensions for Amazon GameLift Metrics

Amazon GameLift supports filtering metrics by the following dimensions.

Dimension	Description
FleetId	Unique identifier for a single fleet. This dimension is used with all metrics for instances, server processes, game sessions, and player sessions. It is not used with metrics for queues and matchmaking.
FleetMetricsGroup	Unique identifier for a collection of fleets. A fleet is included in a fleet metric group by adding the metric group name to the fleet's attributes (see UpdateFleetAttributes()). This dimension is used with all metrics for instances, server processes, game sessions, and player sessions. It is not used with metrics for queues and matchmaking.
QueueName	Unique identifier for a single queue. This dimension is used with metrics for game session placement queues only.
MatchmakingConfigurationName	Unique identifier for a single matchmaking configuration. This dimension is used with metrics for matchmaking only.
MatchmakingConfigurationName-RuleName	Unique identifier for the intersect of a matchmaking configuration and a matchmaking rule. This dimension is used with metrics for matchmaking only.
InstanceType	Unique identifier for an EC2 instance type designation, such as "C4.large". This dimension is used with metrics for spot instances only.
OperatingSystem	Unique identifier for the operating system of an instance. This dimension is used with metrics for spot instances only.

Amazon Inspector Metrics

For information about the Amazon Inspector metrics that you can use with CloudWatch, see [Monitoring Amazon Inspector Using CloudWatch](#) in the Amazon Inspector User Guide.

AWS IoT Metrics and Dimensions

When you interact with AWS IoT, it sends the following metrics to CloudWatch every minute.

AWS IoT Metrics

AWS IoT sends the following metrics to CloudWatch once per received request.

IoT Metrics

Metric	Description
RulesExecuted	The number of AWS IoT rules executed.

Rule Metrics

Metric	Description
TopicMatch	The number of incoming messages published on a topic on which a rule is listening. The <code>RuleName</code> dimension contains the name of the rule.
ParseError	The number of JSON parse errors that occurred in messages published on a topic on which a rule is listening. The <code>RuleName</code> dimension contains the name of the rule.

Rule Action Metrics

Metric	Description
Success	The number of successful rule action invocations. The <code>RuleName</code> dimension contains the name of the rule that specifies the action. The <code>ActionType</code> dimension contains the type of action that was invoked.
Failure	The number of failed rule action invocations. The <code>RuleName</code> dimension contains the name of the rule that specifies the action. The <code>RuleName</code> dimension contains the name of the rule that specifies the action. The <code>ActionType</code> dimension contains the type of action that was invoked.

Message Broker Metrics

Metric	Description
Connect.AuthError	The number of connection requests that could not be authorized by the message broker. The <code>Protocol</code> dimension contains the protocol used to send the <code>CONNECT</code> message.
Connect.ClientError	The number of connection requests rejected because the MQTT message did not meet the requirements defined in AWS IoT Limits . The <code>Protocol</code> dimension contains the protocol used to send the <code>CONNECT</code> message.
Connect.ServerError	The number of connection requests that failed because an internal error occurred. The <code>Protocol</code> dimension contains the protocol used to send the <code>CONNECT</code> message.

Metric	Description
Connect.Success	The number of successful connections to the message broker. The <code>Protocol</code> dimension contains the protocol used to send the <code>CONNECT</code> message.
Connect.Throttle	The number of connection requests that were throttled because the client exceeded the allowed connect request rate. The <code>Protocol</code> dimension contains the protocol used to send the <code>CONNECT</code> message.
Ping.Success	The number of ping messages received by the message broker. The <code>Protocol</code> dimension contains the protocol used to send the ping message.
PublishIn.AuthError	The number of publish requests the message broker was unable to authorize. The <code>Protocol</code> dimension contains the protocol used to publish the message.
PublishIn.ClientError	The number of publish requests rejected by the message broker because the message did not meet the requirements defined in AWS IoT Limits . The <code>Protocol</code> dimension contains the protocol used to publish the message.
PublishIn.ServerError	The number of publish requests the message broker failed to process because an internal error occurred. The <code>Protocol</code> dimension contains the protocol used to send the <code>PUBLISH</code> message.
PublishIn.Success	The number of publish requests successfully processed by the message broker. The <code>Protocol</code> dimension contains the protocol used to send the <code>PUBLISH</code> message.
PublishIn.Throttle	The number of publish request that were throttled because the client exceeded the allowed inbound message rate. The <code>Protocol</code> dimension contains the protocol used to send the <code>PUBLISH</code> message.
PublishOut.AuthError	The number of publish requests made by the message broker that could not be authorized by AWS IoT. The <code>Protocol</code> dimension contains the protocol used to send the <code>PUBLISH</code> message.
PublishOut.ClientError	The number of publish requests made by the message broker that were rejected because the message did not meet the requirements defined in AWS IoT Limits . The <code>Protocol</code> dimension contains the protocol used to send the <code>PUBLISH</code> message.
PublishOut.Success	The number of publish requests successfully made by the message broker. The <code>Protocol</code> dimension contains the protocol used to send the <code>PUBLISH</code> message.
Subscribe.AuthError	The number of subscription requests made by a client that could not be authorized. The <code>Protocol</code> dimension contains the protocol used to send the <code>SUBSCRIBE</code> message.

Metric	Description
Subscribe.ClientError	The number of subscribe requests that were rejected because the SUBSCRIBE message did not meet the requirements defined in AWS IoT Limits . The Protocol dimension contains the protocol used to send the SUBSCRIBE message.
Subscribe.ServerError	The number of subscribe requests that were rejected because an internal error occurred. The Protocol dimension contains the protocol used to send the SUBSCRIBE message.
Subscribe.Success	The number of subscribe requests that were successfully processed by the message broker. The Protocol dimension contains the protocol used to send the SUBSCRIBE message.
Subscribe.Throttle	The number of subscribe requests that were throttled because the client exceeded the allowed subscribe request rate. The Protocol dimension contains the protocol used to send the SUBSCRIBE message.
Unsubscribe.ClientError	The number of unsubscribe requests that were rejected because the UNSUBSCRIBE message did not meet the requirements defined in AWS IoT Limits . The Protocol dimension contains the protocol used to send the UNSUBSCRIBE message.
Unsubscribe.ServerError	The number of unsubscribe requests that were rejected because an internal error occurred. The Protocol dimension contains the protocol used to send the UNSUBSCRIBE message.
Unsubscribe.Success	The number of unsubscribe requests that were successfully processed by the message broker. The Protocol dimension contains the protocol used to send the UNSUBSCRIBE message.
Unsubscribe.Throttle	The number of unsubscribe requests that were rejected because the client exceeded the allowed unsubscribe request rate. The Protocol dimension contains the protocol used to send the UNSUBSCRIBE message.

Note

The message broker metrics are displayed in the AWS IoT console under **Protocol Metrics**.

Thing Shadow Metrics

Metric	Description
DeleteThingShadow.Accepted	The number of DeleteThingShadow requests processed successfully. The Protocol dimension contains the protocol used to make the request.
GetThingShadow.Accepted	The number of GetThingShadow requests processed successfully. The Protocol dimension contains the protocol used to make the request.

Metric	Description
UpdateThingShadow.Accepted	The number of UpdateThingShadow requests processed successfully. The <code>Protocol</code> dimension contains the protocol used to make the request.

Note

The thing shadow metrics are displayed in the AWS IoT console under **Protocol Metrics**.

Jobs Metrics

Metric	Description
ServerError	The number of server errors generated while executing the job. The <code>JobId</code> dimension contains the ID of the job.
ClientError	The number of client errors generated while executing the job. The <code>JobId</code> dimension contains the ID of the job.
QueuedJobExecutionTotalCount	The total number of job executions whose status is <code>QUEUED</code> for the given job. The <code>JobId</code> dimension contains the ID of the job.
InProgressJobExecutionTotalCount	The total number of job executions whose status is <code>IN_PROGRESS</code> for the given job. The <code>JobId</code> dimension contains the ID of the job.
FailedJobExecutionTotalCount	The total number of job executions whose status is <code>FAILED</code> for the given job. The <code>JobId</code> dimension contains the ID of the job.
SucceededJobExecutionTotalCount	The total number of job executions whose status is <code>SUCCESS</code> for the given job. The <code>JobId</code> dimension contains the ID of the job.
CanceledJobExecutionTotalCount	The total number of job executions whose status is <code>CANCELED</code> for the given job. The <code>JobId</code> dimension contains the ID of the job.
RejectedJobExecutionTotalCount	The total number of job executions whose status is <code>REJECTED</code> for the given job. The <code>JobId</code> dimension contains the ID of the job.
RemovedJobExecutionTotalCount	The total number of job executions whose status is <code>REMOVED</code> for the given job. The <code>JobId</code> dimension contains the ID of the job.
QueuedJobExecutionCount	The number of job executions whose status has changed to <code>QUEUED</code> since the last enquiry for the given job. The <code>JobId</code> dimension contains the ID of the job.
InProgressJobExecutionCount	The number of job executions whose status has changed to <code>IN_PROGRESS</code> since the last enquiry for the given job. The <code>JobId</code> dimension contains the ID of the job.

Metric	Description
FailedJobExecutionCount	The number of job executions whose status has changed to <code>FAILED</code> since the last enquiry for the given job. The <code>JobId</code> dimension contains the ID of the job.
SucceededJobExecutionCount	The number of job executions whose status has changed to <code>SUCCESS</code> since the last enquiry for the given job. The <code>JobId</code> dimension contains the ID of the job.
CanceledJobExecutionCount	The number of job executions whose status has changed to <code>CANCELED</code> since the last enquiry for the given job. The <code>JobId</code> dimension contains the ID of the job.
RejectedJobExecutionCount	The number of job executions whose status has changed to <code>REJECTED</code> since the last enquiry for the given job. The <code>JobId</code> dimension contains the ID of the job.
RemovedJobExecutionCount	The number of job executions whose status has changed to <code>REMOVED</code> since the last enquiry for the given job. The <code>JobId</code> dimension contains the ID of the job.

Dimensions for Metrics

Metrics use the namespace and provide metrics for the following dimension(s):

Dimension	Description
ActionType	The action type specified by the rule that triggered by the request.
Protocol	The protocol used to make the request. Valid values are: MQTT or HTTP
RuleName	The name of the rule triggered by the request.
JobId	The ID of the job whose progress or message connection success/failure is being monitored.

Amazon Kinesis Data Analytics Metrics

Kinesis Data Analytics sends metrics to CloudWatch. For more information, see [Monitoring with Amazon CloudWatch Metrics](#) in the *Amazon Kinesis Data Analytics Developer Guide*.

Metrics

The `AWS/KinesisAnalytics` namespace includes the following metrics.

Metric	Description
Bytes	The number of bytes read (per input stream) or written (per output stream).

Metric	Description
	Levels: Per input stream and per output stream
MillisBehindLatest	Indicates how far behind from the current time an application is reading from the streaming source. Levels: Application-level
Records	The number of records read (per input stream) or written (per output stream). Levels: Per input stream and per output stream
Success	1 for each successful delivery attempt to the destination configured for your application; 0 for every failed delivery attempt. The average value of this metric indicates how many successful deliveries are performed. Levels: Per destination.
InputProcessing.Duration	The time taken for each Lambda function invocation performed by Kinesis Data Analytics. Levels: Per input stream
InputProcessing.OkRecords	The number of records returned by a Lambda function that were marked with Ok status. Levels: Per input stream
InputProcessing.OkBytes	The sum of bytes of the records returned by a Lambda function that were marked with Ok status. Levels: Per input stream
InputProcessing.DroppedRecords	The number of records returned by a Lambda function that were marked with Dropped status. Levels: Per input stream
InputProcessing.ProcessingFailedRecords	The number of records returned by a Lambda function that were marked with ProcessingFailed status. Levels: Per input stream
InputProcessing.Success	The number of successful Lambda invocations by Kinesis Data Analytics. Levels: Per input stream
LambdaDelivery.OkRecords	The number of records returned by a Lambda function that were marked with Ok status. Levels: Per Lambda destination
LambdaDelivery.DeliveryFailedRecords	The number of records returned by a Lambda function that were marked with DeliveryFailed status. Levels: Per Lambda destination

Metric	Description
<code>LambdaDelivery.Duration</code>	The time taken for each Lambda function invocation performed by Kinesis Data Analytics. Levels: Per Lambda destination

Dimensions for Metrics

Amazon Kinesis Data Analytics provides metrics for the following dimensions.

Dimension	Description
Flow	Per input stream: Input Per output stream: Output
Id	Per input stream: Input Id Per output stream: Output Id

Amazon Kinesis Data Firehose Metrics

Kinesis Data Firehose sends metrics to CloudWatch. For more information, see [Monitoring with Amazon CloudWatch Metrics](#) in the *Amazon Kinesis Data Firehose Developer Guide*.

Service-level CloudWatch Metrics

The `AWS/Firehose` namespace includes the following service-level metrics.

Metric	Description
<code>BackupToS3.Bytes</code>	The number of bytes delivered to Amazon S3 for backup over the specified time period. Kinesis Data Firehose emits this metric when data transformation is enabled for Amazon S3 or Amazon Redshift destinations. Units: Bytes
<code>BackupToS3.DataFreshness</code>	Age (from getting into Kinesis Data Firehose to now) of the oldest record in Kinesis Data Firehose. Any record older than this age has been delivered to the Amazon S3 bucket for backup. Kinesis Data Firehose emits this metric when data transformation is enabled for Amazon S3 or Amazon Redshift destinations. Units: Seconds
<code>BackupToS3.Records</code>	The number of records delivered to Amazon S3 for backup over the specified time period. Kinesis Data Firehose emits this metric when data transformation is enabled for Amazon S3 or Amazon Redshift destinations. Units: Count

Metric	Description
<code>BackupToS3.Success</code>	Sum of successful Amazon S3 put commands for backup over sum of all Amazon S3 backup put commands. Kinesis Data Firehose emits this metric when data transformation is enabled for Amazon S3 or Amazon Redshift destinations.
<code>DeliveryToElasticsearch.Bytes</code>	The number of bytes indexed to Amazon ES over the specified time period. Units: Bytes
<code>DeliveryToElasticsearch.Records</code>	The number of records indexed to Amazon ES over the specified time period. Units: Count
<code>DeliveryToElasticsearch.Success</code>	The sum of the successfully indexed records over the sum of records that were attempted.
<code>DeliveryToRedshift.Bytes</code>	The number of bytes copied to Amazon Redshift over the specified time period. Units: Bytes
<code>DeliveryToRedshift.Records</code>	The number of records copied to Amazon Redshift over the specified time period. Units: Count
<code>DeliveryToRedshift.Success</code>	The sum of successful Amazon Redshift COPY commands over the sum of all Amazon Redshift COPY commands.
<code>DeliveryToS3.Bytes</code>	The number of bytes delivered to Amazon S3 over the specified time period. Units: Bytes
<code>DeliveryToS3.DataFreshness</code>	The age (from getting into Kinesis Data Firehose to now) of the oldest record in Kinesis Data Firehose. Any record older than this age has been delivered to the S3 bucket. Units: Seconds
<code>DeliveryToS3.Records</code>	The number of records delivered to Amazon S3 over the specified time period. Units: Count
<code>DeliveryToS3.Success</code>	The sum of successful Amazon S3 put commands over the sum of all Amazon S3 put commands.
<code>DeliveryToSplunk.Bytes</code>	The number of bytes delivered to Splunk over the specified time period. Units: Bytes

Metric	Description
<code>DeliveryToSplunk.DataFreshness</code>	Age (from getting into Kinesis Firehose to now) of the oldest record in Kinesis Firehose. Any record older than this age has been delivered to Splunk. Units: Seconds
<code>DeliveryToSplunk.Records</code>	The number of records delivered to Splunk over the specified time period. Units: Count
<code>DeliveryToSplunk.Success</code>	The sum of the successfully indexed records over the sum of records that were attempted.
<code>IncomingBytes</code>	The number of bytes ingested into the Kinesis Data Firehose stream over the specified time period. Units: Bytes
<code>IncomingRecords</code>	The number of records ingested into the Kinesis Data Firehose stream over the specified time period. Units: Count

API-Level CloudWatch Metrics

The `AWS/Firehose` namespace includes the following API-level metrics.

Metric	Description
<code>DescribeDeliveryStream.Latency</code>	The time taken per <code>DescribeDeliveryStream</code> operation, measured over the specified time period. Units: Milliseconds
<code>DescribeDeliveryStream.Requests</code>	The total number of <code>DescribeDeliveryStream</code> requests. Units: Count
<code>ListDeliveryStreams.Latency</code>	The time taken per <code>ListDeliveryStream</code> operation, measured over the specified time period. Units: Milliseconds
<code>ListDeliveryStreams.Requests</code>	The total number of <code>ListFirehose</code> requests. Units: Count
<code>PutRecord.Bytes</code>	The number of bytes put to the Kinesis Data Firehose delivery stream using <code>PutRecord</code> over the specified time period. Units: Bytes
<code>PutRecord.Latency</code>	The time taken per <code>PutRecord</code> operation, measured over the specified time period.

Metric	Description
	Units: Milliseconds
<code>PutRecord.Requests</code>	The total number of <code>PutRecord</code> requests, which is equal to total number of records from <code>PutRecord</code> operations. Units: Count
<code>PutRecordBatch.Bytes</code>	The number of bytes put to the Kinesis Data Firehose delivery stream using <code>PutRecordBatch</code> over the specified time period. Units: Bytes
<code>PutRecordBatch.Latency</code>	The time taken per <code>PutRecordBatch</code> operation, measured over the specified time period. Units: Milliseconds
<code>PutRecordBatch.Records</code>	The total number of records from <code>PutRecordBatch</code> operations. Units: Count
<code>PutRecordBatch.Requests</code>	The total number of <code>PutRecordBatch</code> requests. Units: Count
<code>UpdateDeliveryStream.Latency</code>	The time taken per <code>UpdateDeliveryStream</code> operation, measured over the specified time period. Units: Milliseconds
<code>UpdateDeliveryStream.Requests</code>	The total number of <code>UpdateDeliveryStream</code> requests. Units: Count

Data Transformation CloudWatch Metrics

If data transformation with Lambda is enabled, the `AWS/Firehose` namespace includes the following metrics.

Metric	Description
<code>ExecuteProcessing.Duration</code>	The time it takes for each Lambda function invocation performed by Kinesis Data Firehose. Units: Seconds
<code>ExecuteProcessing.Success</code>	The sum of the successful Lambda function invocations over the sum of the total Lambda function invocations.
<code>SucceedProcessing.Records</code>	The number of successfully processed records over the specified time period. Units: Count
<code>SucceedProcessing.Bytes</code>	The number of successfully processed bytes over the specified time period.

Metric	Description
	Units: Bytes

Amazon Kinesis Data Streams Metrics and Dimensions

Kinesis Data Streams sends metrics to CloudWatch at two levels; the stream level and, optionally, the shard level. Stream-level metrics are for most common monitoring use cases in normal conditions. Shard-level metrics are for specific monitoring tasks, usually related to troubleshooting. For more information, see [Monitoring Amazon Kinesis with Amazon CloudWatch](#) in the *Amazon Kinesis Developer Guide*.

Contents

- [Basic Stream-level Metrics \(p. 204\)](#)
- [Enhanced Shard-level Metrics \(p. 208\)](#)
- [Dimensions for Amazon Kinesis Metrics \(p. 210\)](#)

Basic Stream-level Metrics

The `AWS/Kinesis` namespace includes the following stream-level metrics.

Kinesis Data Streams sends these stream-level metrics to CloudWatch every minute. These metrics are always available.

Metric	Description
<code>GetRecords.Bytes</code>	<p>The number of bytes retrieved from the Kinesis stream, measured over the specified time period. Minimum, Maximum, and Average statistics represent the bytes in a single <code>GetRecords</code> operation for the stream in the specified time period.</p> <p>Shard-level metric name: <code>OutgoingBytes</code></p> <p>Dimensions: <code>StreamName</code></p> <p>Statistics: Minimum, Maximum, Average, Sum, Samples</p> <p>Units: Bytes</p>
<code>GetRecords.IteratorAge</code>	<p>This metric is deprecated. Use <code>GetRecords.IteratorAgeMilliseconds</code>.</p>
<code>GetRecords.IteratorAgeMilliseconds</code>	<p>The age of the last record in all <code>GetRecords</code> calls made against an Kinesis stream, measured over the specified time period. Age is the difference between the current time and when the last record of the <code>GetRecords</code> call was written to the stream. The Minimum and Maximum statistics can be used to track the progress of Kinesis consumer applications. A value of zero indicates that the records being read are completely caught up with the stream.</p>

Metric	Description
	Shard-level metric name: <code>IteratorAgeMilliseconds</code> Dimensions: <code>StreamName</code> Statistics: Minimum, Maximum, Average, Samples Units: Milliseconds
<code>GetRecords.Latency</code>	The time taken per <code>GetRecords</code> operation, measured over the specified time period. Dimensions: <code>StreamName</code> Statistics: Minimum, Maximum, Average Units: Milliseconds
<code>GetRecords.Records</code>	The number of records retrieved from the shard, measured over the specified time period. Minimum, Maximum, and Average statistics represent the records in a single <code>GetRecords</code> operation for the stream in the specified time period. Shard-level metric name: <code>OutgoingRecords</code> Dimensions: <code>StreamName</code> Statistics: Minimum, Maximum, Average, Sum, Samples Units: Count
<code>GetRecords.Success</code>	The number of successful <code>GetRecords</code> operations per stream, measured over the specified time period. Dimensions: <code>StreamName</code> Statistics: Average, Sum, Samples Units: Count
<code>IncomingBytes</code>	The number of bytes successfully put to the Kinesis stream over the specified time period. This metric includes bytes from <code>PutRecord</code> and <code>PutRecords</code> operations. Minimum, Maximum, and Average statistics represent the bytes in a single put operation for the stream in the specified time period. Shard-level metric name: <code>IncomingBytes</code> Dimensions: <code>StreamName</code> Statistics: Minimum, Maximum, Average, Sum, Samples Units: Bytes

Metric	Description
<code>IncomingRecords</code>	<p>The number of records successfully put to the Kinesis stream over the specified time period. This metric includes record counts from <code>PutRecord</code> and <code>PutRecords</code> operations. Minimum, Maximum, and Average statistics represent the records in a single put operation for the stream in the specified time period.</p> <p>Shard-level metric name: <code>IncomingRecords</code></p> <p>Dimensions: <code>StreamName</code></p> <p>Statistics: Minimum, Maximum, Average, Sum, Samples</p> <p>Units: Count</p>
<code>PutRecord.Bytes</code>	<p>The number of bytes put to the Kinesis stream using the <code>PutRecord</code> operation over the specified time period.</p> <p>Dimensions: <code>StreamName</code></p> <p>Statistics: Minimum, Maximum, Average, Sum, Samples</p> <p>Units: Bytes</p>
<code>PutRecord.Latency</code>	<p>The time taken per <code>PutRecord</code> operation, measured over the specified time period.</p> <p>Dimensions: <code>StreamName</code></p> <p>Statistics: Minimum, Maximum, Average</p> <p>Units: Milliseconds</p>
<code>PutRecord.Success</code>	<p>The number of successful <code>PutRecord</code> operations per Kinesis stream, measured over the specified time period. Average reflects the percentage of successful writes to a stream.</p> <p>Dimensions: <code>StreamName</code></p> <p>Statistics: Average, Sum, Samples</p> <p>Units: Count</p>
<code>PutRecords.Bytes</code>	<p>The number of bytes put to the Kinesis stream using the <code>PutRecords</code> operation over the specified time period.</p> <p>Dimensions: <code>StreamName</code></p> <p>Statistics: Minimum, Maximum, Average, Sum, Samples</p> <p>Units: Bytes</p>

Metric	Description
<code>PutRecords.Latency</code>	<p>The time taken per <code>PutRecords</code> operation, measured over the specified time period.</p> <p>Dimensions: <code>StreamName</code></p> <p>Statistics: Minimum, Maximum, Average</p> <p>Units: Milliseconds</p>
<code>PutRecords.Records</code>	<p>The number of successful records in a <code>PutRecords</code> operation per Kinesis stream, measured over the specified time period.</p> <p>Dimensions: <code>StreamName</code></p> <p>Statistics: Minimum, Maximum, Average, Sum, Samples</p> <p>Units: Count</p>
<code>PutRecords.Success</code>	<p>The number of <code>PutRecords</code> operations where at least one record succeeded, per Kinesis stream, measured over the specified time period.</p> <p>Dimensions: <code>StreamName</code></p> <p>Statistics: Average, Sum, Samples</p> <p>Units: Count</p>
<code>ReadProvisionedThroughputExceeded</code>	<p>The number of <code>GetRecords</code> calls throttled for the stream over the specified time period. The most commonly used statistic for this metric is Average.</p> <p>When the Minimum statistic has a value of 1, all records were throttled for the stream during the specified time period.</p> <p>When the Maximum statistic has a value of 0 (zero), no records were throttled for the stream during the specified time period.</p> <p>Shard-level metric name: <code>ReadProvisionedThroughputExceeded</code></p> <p>Dimensions: <code>StreamName</code></p> <p>Statistics: Minimum, Maximum, Average, Sum, Samples</p> <p>Units: Count</p>

Metric	Description
<code>WriteProvisionedThroughputExceeded</code>	<p>The number of records rejected due to throttling for the stream over the specified time period. This metric includes throttling from <code>PutRecord</code> and <code>PutRecords</code> operations. The most commonly used statistic for this metric is <code>Average</code>.</p> <p>When the <code>Minimum</code> statistic has a non-zero value, records were being throttled for the stream during the specified time period.</p> <p>When the <code>Maximum</code> statistic has a value of 0 (zero), no records were being throttled for the stream during the specified time period.</p> <p>Shard-level metric name: <code>WriteProvisionedThroughputExceeded</code></p> <p>Dimensions: <code>StreamName</code></p> <p>Statistics: <code>Minimum</code>, <code>Maximum</code>, <code>Average</code>, <code>Sum</code>, <code>Samples</code></p> <p>Units: <code>Count</code></p>

Enhanced Shard-level Metrics

The `AWS/Kinesis` namespace includes the following shard-level metrics.

Kinesis sends the following shard-level metrics to CloudWatch every minute. These metrics are not enabled by default. There is a charge for enhanced metrics emitted from Kinesis. For more information, see [Amazon CloudWatch Pricing](#) under the heading *Amazon CloudWatch Custom Metrics*. The charges are given per shard per metric per month.

Metric	Description
<code>IncomingBytes</code>	<p>The number of bytes successfully put to the shard over the specified time period. This metric includes bytes from <code>PutRecord</code> and <code>PutRecords</code> operations. <code>Minimum</code>, <code>Maximum</code>, and <code>Average</code> statistics represent the bytes in a single put operation for the shard in the specified time period.</p> <p>Stream-level metric name: <code>IncomingBytes</code></p> <p>Dimensions: <code>StreamName</code>, <code>ShardId</code></p> <p>Statistics: <code>Minimum</code>, <code>Maximum</code>, <code>Average</code>, <code>Sum</code>, <code>Samples</code></p> <p>Units: <code>Bytes</code></p>
<code>IncomingRecords</code>	<p>The number of records successfully put to the shard over the specified time period. This metric includes record counts from <code>PutRecord</code> and <code>PutRecords</code> operations. <code>Minimum</code>, <code>Maximum</code>, and <code>Average</code> statistics represent the records in a single put operation for the shard in the specified time period.</p>

Metric	Description
	<p>Stream-level metric name: <code>IncomingRecords</code></p> <p>Dimensions: <code>StreamName</code>, <code>ShardId</code></p> <p>Statistics: Minimum, Maximum, Average, Sum, Samples</p> <p>Units: Count</p>
<code>IteratorAgeMilliseconds</code>	<p>The age of the last record in all <code>GetRecords</code> calls made against a shard, measured over the specified time period. Age is the difference between the current time and when the last record of the <code>GetRecords</code> call was written to the stream. The Minimum and Maximum statistics can be used to track the progress of Kinesis consumer applications. A value of 0 (zero) indicates that the records being read are completely caught up with the stream.</p> <p>Stream-level metric name: <code>GetRecords.IteratorAgeMilliseconds</code></p> <p>Dimensions: <code>StreamName</code>, <code>ShardId</code></p> <p>Statistics: Minimum, Maximum, Average, Samples</p> <p>Units: Milliseconds</p>
<code>OutgoingBytes</code>	<p>The number of bytes retrieved from the shard, measured over the specified time period. Minimum, Maximum, and Average statistics represent the bytes in a single <code>GetRecords</code> operation for the shard in the specified time period.</p> <p>Stream-level metric name: <code>GetRecords.Bytes</code></p> <p>Dimensions: <code>StreamName</code>, <code>ShardId</code></p> <p>Statistics: Minimum, Maximum, Average, Sum, Samples</p> <p>Units: Bytes</p>
<code>OutgoingRecords</code>	<p>The number of records retrieved from the shard, measured over the specified time period. Minimum, Maximum, and Average statistics represent the records in a single <code>GetRecords</code> operation for the shard in the specified time period.</p> <p>Stream-level metric name: <code>GetRecords.Records</code></p> <p>Dimensions: <code>StreamName</code>, <code>ShardId</code></p> <p>Statistics: Minimum, Maximum, Average, Sum, Samples</p> <p>Units: Count</p>

Metric	Description
<code>ReadProvisionedThroughputExceeded</code>	<p>The number of <code>GetRecords</code> calls throttled for the shard over the specified time period. This exception count covers all dimensions of the following limits: 5 reads per shard per second or 2 MB per second per shard. The most commonly used statistic for this metric is Average.</p> <p>When the Minimum statistic has a value of 1, all records were throttled for the shard during the specified time period.</p> <p>When the Maximum statistic has a value of 0 (zero), no records were throttled for the shard during the specified time period.</p> <p>Stream-level metric name: <code>ReadProvisionedThroughputExceeded</code></p> <p>Dimensions: <code>StreamName</code>, <code>ShardId</code></p> <p>Statistics: Minimum, Maximum, Average, Sum, Samples</p> <p>Units: Count</p>
<code>WriteProvisionedThroughputExceeded</code>	<p>The number of records rejected due to throttling for the shard over the specified time period. This metric includes throttling from <code>PutRecord</code> and <code>PutRecords</code> operations and covers all dimensions of the following limits: 1,000 records per second per shard or 1 MB per second per shard. The most commonly used statistic for this metric is Average.</p> <p>When the Minimum statistic has a non-zero value, records were being throttled for the shard during the specified time period.</p> <p>When the Maximum statistic has a value of 0 (zero), no records were being throttled for the shard during the specified time period.</p> <p>Stream-level metric name: <code>WriteProvisionedThroughputExceeded</code></p> <p>Dimensions: <code>StreamName</code>, <code>ShardId</code></p> <p>Statistics: Minimum, Maximum, Average, Sum, Samples</p> <p>Units: Count</p>

Dimensions for Amazon Kinesis Metrics

You can use the following dimensions to filter the metrics for Amazon Kinesis Data Streams.

Dimension	Description
<code>StreamName</code>	The name of the Kinesis stream.

Dimension	Description
ShardId	The shard ID within the Kinesis stream.

Amazon Kinesis Video Streams Metrics and Dimensions

Metrics

The AWS/KinesisVideo namespace includes the following metrics.

Metric	Description
PutMedia.Requests	Number of PutMedia API requests for a given stream. Units: Count
PutMedia.IncomingBytes	Number of bytes received as part of PutMedia for the stream. Units: Bytes
PutMedia.IncomingFragments	Number of complete fragments received as part of PutMedia for the stream. Units: Count
PutMedia.IncomingFrames	Number of complete frames received as part of PutMedia for the stream. Units: Count
PutMedia.ActiveConnections	The total number of connections to the service host. Units: Count
PutMedia.ConnectionErrors	Errors while establishing PutMedia connection for the stream. Units: Count
PutMedia.FragmentIngestionLatency	Time difference between when the first and last bytes of a fragment are received by Kinesis Video Streams. Units: Milliseconds
PutMedia.FragmentPersistLatency	Time taken from when the complete fragment data is received and archived. Units: Count
PutMedia.Latency	Time difference between the request and the HTTP response from InletService while establishing the connection Units: Count

Metric	Description
<code>PutMedia.BufferingAckLatency</code>	Time difference between when the first byte of a new fragment is received by Kinesis Video Streams and when the Buffering Ack is sent for the fragment Units: Milliseconds
<code>PutMedia.ReceivedAckLatency</code>	Time difference between when the last byte of a new fragment is received by Kinesis Video Streams and when the Received ACK is sent for the fragment. Units: Milliseconds
<code>PutMedia.PersistedAckLatency</code>	Time difference between when the last byte of a new fragment is received by Kinesis Video Streams and when the Persisted ACK is sent for the fragment. Units: Milliseconds
<code>PutMedia.ErrorAckCount</code>	Number of Error ACKs sent while doing PutMedia for the stream. Units: Count
<code>PutMedia.Success</code>	1 for each fragment successfully written; 0 for every failed fragment. The average value of this metric indicates how many complete, valid fragments are sent. Units: Count
<code>GetMedia.Requests</code>	Number of GetMedia API requests for a given stream. Units: Count
<code>GetMedia.OutgoingBytes</code>	Total number of bytes sent out from the service as part of the GetMedia API for a given stream. Units: Bytes
<code>GetMedia.OutgoingFragments</code>	Number of fragments sent while doing GetMedia for the stream. Units: Count
<code>GetMedia.OutgoingFrames</code>	Number of frames sent during GetMedia on the given stream. Units: Count
<code>GetMedia.MillisBehindNow</code>	Time difference between the current server time stamp and the server time stamp of the last fragment sent. Units: Milliseconds
<code>GetMedia.ConnectionErrors</code>	The number of connections that were not successfully established. Units: Count

Metric	Description
<code>GetMedia.Success</code>	1 for every fragment successfully sent; 0 for every failure. The average value indicates the rate of success. Units: Count
<code>GetMediaForFragmentList.OutgoingBytes</code>	Total number of bytes sent out from the service as part of the <code>GetMediaForFragmentList</code> API for a given stream. Units: Bytes
<code>GetMediaForFragmentList.OutgoingFragments</code>	Total number of fragments sent out from the service as part of the <code>GetMediaForFragmentList</code> API for a given stream. Units: Count
<code>GetMediaForFragmentList.OutgoingFrames</code>	Total number of frames sent out from the service as part of the <code>GetMediaForFragmentList</code> API for a given stream. Units: Count
<code>GetMediaForFragmentList.Requests</code>	Number of <code>GetMediaForFragmentList</code> API requests for a given stream. Units: Count
<code>GetMediaForFragmentList.Success</code>	1 for every fragment successfully sent; 0 for every failure. The average value indicates the rate of success. Units: Count
<code>ListFragments.Latency</code>	Latency of the <code>ListFragments</code> API calls for the given stream name. Units: Milliseconds

Dimensions for Amazon Kinesis Video Streams Metrics

You can use the following dimensions to filter the metrics for Amazon Kinesis Video Streams.

Dimension	Description
<code>StreamName</code>	The name of the Kinesis video stream.

AWS Key Management Service Metrics and Dimensions

When you use AWS Key Management Service (AWS KMS) to [import key material](#) into a customer master key (CMK) and set it to expire, AWS KMS sends metrics and dimensions to CloudWatch. For more

information, see [Monitoring with Amazon CloudWatch](#) in the *AWS Key Management Service Developer Guide*.

AWS KMS Metrics

The `AWS/KMS` namespace includes the following metrics.

SecondsUntilKeyMaterialExpiration

This metric tracks the number of seconds remaining until imported key material expires. This metric is valid only for CMKs whose origin is `EXTERNAL` and whose key material is or was set to expire. The most useful statistic for this metric is `Minimum`, which tells you the smallest amount of time remaining for all data points in the specified statistic period. The only valid unit for this metric is `Seconds`.

Use this metric to track the amount of time that remains until your imported key material expires. When that amount of time falls below a threshold that you define, you might want to take action such as reimporting the key material with a new expiration date. You can create a CloudWatch alarm to notify you when that happens. For more information, see [Creating CloudWatch Alarms to Monitor AWS KMS Metrics](#) in the *AWS Key Management Service Developer Guide*.

Dimensions for AWS KMS Metrics

AWS KMS metrics use the `AWS/KMS` namespace and have only one valid dimension: `KeyId`. You can use this dimension to view metric data for a specific CMK or set of CMKs.

AWS Lambda Metrics and Dimensions

AWS Lambda sends metrics to CloudWatch every minute. For more information, see [Troubleshooting and Monitoring AWS Lambda Functions with Amazon CloudWatch](#) in the *AWS Lambda Developer Guide*.

AWS Lambda CloudWatch Metrics

The `AWS/Lambda` namespace includes the following metrics.

Metric	Description
<code>Invocations</code>	<p>Measures the number of times a function is invoked in response to an event or invocation API call. This replaces the deprecated <code>RequestCount</code> metric. This includes successful and failed invocations, but does not include throttled attempts. This equals the billed requests for the function. Note that AWS Lambda only sends these metrics to CloudWatch if they have a nonzero value.</p> <p>Units: Count</p>
<code>Errors</code>	<p>Measures the number of invocations that failed due to errors in the function (response code 4XX). This replaces the deprecated <code>ErrorCount</code> metric. Failed invocations may trigger a retry attempt that succeeds. This includes:</p> <ul style="list-style-type: none">Handled exceptions (for example, <code>context.fail(error)</code>)Unhandled exceptions causing the code to exitOut of memory exceptions

Metric	Description
	<ul style="list-style-type: none"> Timeouts Permissions errors <p>This does not include invocations that fail due to invocation rates exceeding default concurrent limits (error code 429) or failures due to internal service errors (error code 500).</p> <p>Units: Count</p>
Dead Letter Error	<p>Incremented when Lambda is unable to write the failed event payload to your configured Dead Letter Queues. This could be due to the following:</p> <ul style="list-style-type: none"> Permissions errors Throttles from downstream services Misconfigured resources Timeouts <p>Units: Count</p>
Duration	<p>Measures the elapsed wall clock time from when the function code starts executing as a result of an invocation to when it stops executing. This replaces the deprecated Latency metric. The maximum data point value possible is the function timeout configuration. The billed duration will be rounded up to the nearest 100 millisecond. Note that AWS Lambda only sends these metrics to CloudWatch if they have a nonzero value.</p> <p>Units: Milliseconds</p>
Throttles	<p>Measures the number of Lambda function invocation attempts that were throttled due to invocation rates exceeding the customer's concurrent limits (error code 429). Failed invocations may trigger a retry attempt that succeeds.</p> <p>Units: Count</p>
IteratorAge	<p>Emitted for stream-based invocations only (functions triggered by an Amazon DynamoDB stream or Kinesis stream). Measures the age of the last record for each batch of records processed. Age is the difference between the time Lambda received the batch, and the time the last record in the batch was written to the stream.</p> <p>Units: Milliseconds</p>
ConcurrentExecutions	<p>Emitted as an aggregate metric for all functions in the account, and for functions that have a custom concurrency limit specified. Not applicable for versions or aliases. Measures the sum of concurrent executions for a given function at a given point in time. Must be viewed as an average metric if aggregated across a time period.</p> <p>Units: Count</p>

Metric	Description
UnreservedConcurrentExecutions	<p>Emitted as an aggregate metric for all functions in the account only. Not applicable for functions, versions, or aliases. Represents the sum of the concurrency of the functions that do not have a custom concurrency limit specified. Must be viewed as an average metric if aggregated across a time period.</p> <p>Units: Count</p>

Errors/Invocations Ratio

When calculating the error rate on Lambda function invocations, it's important to distinguish between an invocation request and an actual invocation. It is possible for the error rate to exceed the number of billed Lambda function invocations. Lambda reports an invocation metric only if the Lambda function code is executed. If the invocation request yields a throttling or other initialization error that prevents the Lambda function code from being invoked, Lambda will report an error, but it does not log an invocation metric.

- Lambda emits `Invocations=1` when the function is executed. If the Lambda function is not executed, nothing is emitted.
- Lambda emits a data point for `Errors` for each invoke request. `Errors=0` means that there is no function execution error. `Errors=1` means that there is a function execution error.
- Lambda emits a data point for `Throttles` for each invoke request. `Throttles=0` means there is no invocation throttle. `Throttles=1` means there is an invocation throttle.

Dimensions for AWS Lambda Metrics

Lambda data can be filtered along any of the following dimensions in the table below.

AWS Lambda CloudWatch Dimensions

You can use the dimensions in the following table to refine the metrics returned for your Lambda functions.

Dimension	Description
FunctionName	Filters the metric data by Lambda function.
Resource	Filters the metric data by Lambda function resource, such as function version or alias.
Version	Filters the data you request for a Lambda version.
Alias	Filters the data you request for a Lambda alias.
Executed Version	Filters the metric data by Lambda function versions. This only applies to alias invocations.

Amazon Lex Metrics

For information about the Amazon Lex metrics that you can use with CloudWatch, see [CloudWatch Metrics for Amazon Lex](#) in the Amazon Lex Developer Guide.

Amazon Machine Learning Metrics and Dimensions

Amazon Machine Learning sends metrics to CloudWatch every five minutes. For more information, see [Monitoring Amazon ML with Amazon CloudWatch Metrics](#) in the *Amazon Machine Learning Developer Guide*.

Amazon ML Metrics

The AWS/ML namespace includes the following metrics.

Metric	Description
PredictCount	The number of observations received by Amazon ML, measured over the specified time period. Units: Count
PredictFailureCount	The number of invalid or malformed observations received by Amazon ML, measured over the specified time period. Units: Count

Dimensions for Amazon Machine Learning Metrics

Amazon ML data can be filtered along any of the following dimensions in the table below.

Dimension	Description
MLModelId	The identifier of an Amazon ML model. All available statistics are filtered by MLModelId.
RequestMode	An indicator specifying whether observations were received as part of a batch prediction request or as real-time predict requests. All available statistics are filtered by RequestMode.

Amazon MQ Metrics

Amazon MQ and Amazon CloudWatch are integrated so you can use CloudWatch to view and analyze metrics for your ActiveMQ broker and the broker's destinations (queues and topics). You can view and analyze your Amazon MQ metrics from the CloudWatch console, the AWS CLI, or the CloudWatch CLI. CloudWatch metrics for Amazon MQ are automatically polled from the broker and then pushed to CloudWatch every minute. For more information, see [Monitoring Amazon MQ with CloudWatch](#) in the *Amazon MQ Developer Guide*.

Note

The following statistics are valid for all of the metrics:

- Average
- Minimum
- Maximum
- Sum

The AWS/AmazonMQ namespace includes the following metrics.

Broker Metrics

Metric	Unit	Description
CpuUtilization	Percent	The percentage of allocated EC2 compute units that the broker currently uses.
HeapUsage	Percent	The percentage of the ActiveMQ JVM memory limit that the broker currently uses.
NetworkIn	Bytes	The volume of incoming traffic for the broker.
NetworkOut	Bytes	The volume of outgoing traffic for the broker.
TotalMessageCount	Count	The number of messages stored on the broker.

Dimension for Broker Metrics

Dimension	Description
Broker	The name of the broker. Note A single-instance broker has the suffix -1. An active-standby broker for high availability has the suffixes -1 and -2 for its redundant pair.

Destination (Queue and Topic) Metrics

Important

The following metrics record only values since CloudWatch polled the metrics last:

- EnqueueCount
- ExpiredCount
- DequeueCount
- DispatchCount

Metric	Unit	Description
ConsumerCount	Count	The number of consumers subscribed to the destination.
EnqueueCount	Count	The number of messages sent to the destination.

Metric	Unit	Description
EnqueueTime	Time (milliseconds)	The amount of time it takes the broker to accept a message from the producer and send it to the destination.
ExpiredCount	Count	The number of messages that couldn't be delivered because they expired.
DispatchCount	Count	The number of messages sent to consumers.
DequeueCount	Count	The number of messages acknowledged by consumers.
MemoryUsage	Percent	The percentage of the memory limit that the destination currently uses.
ProducerCount	Count	The number of producers for the destination.
QueueSize	Count	The number of messages in the queue. Important This metric applies only to queues.

Dimensions for Destination (Queue and Topic) Metrics

Dimension	Description
Broker	The name of the broker. Note A single-instance broker has the suffix -1. An active-standby broker for high availability has the suffixes -1 and -2 for its redundant pair.
Topic or Queue	The name of the topic or queue.

AWS OpsWorks Metrics and Dimensions

AWS OpsWorks sends metrics to CloudWatch for each active stack every minute. Detailed monitoring is enabled by default. For more information, see [Monitoring](#) in the *AWS OpsWorks User Guide*.

AWS OpsWorks Stacks Metrics

AWS OpsWorks Stacks sends the following metrics to CloudWatch every five minutes.

CPU Metrics

Metric	Description
<code>cpu_idle</code>	<p>The percentage of time that the CPU is idle.</p> <p>Valid Dimensions: The IDs of the individual resources for which you are viewing metrics: <code>StackId</code>, <code>LayerId</code>, or <code>InstanceId</code>.</p> <p>Valid Statistics: Average, Minimum, Maximum, Sum, or Data Samples.</p> <p>Unit: None</p>
<code>cpu_nice</code>	<p>The percentage of time that the CPU is handling processes with a positive <code>nice</code> value, which have a lower scheduling priority. For more information about what this measures, see nice (Unix).</p> <p>Valid Dimensions: The IDs of the individual resources for which you are viewing metrics: <code>StackId</code>, <code>LayerId</code>, or <code>InstanceId</code>.</p> <p>Valid Statistics: Average, Minimum, Maximum, Sum, or Data Samples.</p> <p>Unit: None</p>
<code>cpu_steal</code>	<p>As AWS allocates hypervisor CPU resources among increasing numbers of instances, virtualization load rises, and can affect how often the hypervisor can perform requested work on an instance. <code>cpu_steal</code> measures the percentage of time that an instance is waiting for the hypervisor to allocate physical CPU resources.</p> <p>Valid Dimensions: The IDs of the individual resources for which you are viewing metrics: <code>StackId</code>, <code>LayerId</code>, or <code>InstanceId</code>.</p> <p>Valid Statistics: Average, Minimum, Maximum, Sum, or Data Samples.</p> <p>Unit: None</p>
<code>cpu_system</code>	<p>The percentage of time that the CPU is handling system operations.</p> <p>Valid Dimensions: The IDs of the individual resources for which you are viewing metrics: <code>StackId</code>, <code>LayerId</code>, or <code>InstanceId</code>.</p> <p>Valid Statistics: Average, Minimum, Maximum, Sum, or Data Samples.</p> <p>Unit: None</p>
<code>cpu_user</code>	<p>The percentage of time that the CPU is handling user operations.</p>

Metric	Description
	<p>Valid Dimensions: The IDs of the individual resources for which you are viewing metrics: StackId, LayerId, or InstanceId.</p> <p>Valid Statistics: Average, Minimum, Maximum, Sum, or Data Samples.</p> <p>Unit: None</p>
cpu_waitio	<p>The percentage of time that the CPU is waiting for input/output operations.</p> <p>Valid Dimensions: The IDs of the individual resources for which you are viewing metrics: StackId, LayerId, or InstanceId.</p> <p>Valid Statistics: Average, Minimum, Maximum, Sum, or Data Samples.</p> <p>Unit: None</p>

Memory Metrics

Metric	Description
memory_buffers	<p>The amount of buffered memory.</p> <p>Valid Dimensions: The IDs of the individual resources for which you are viewing metrics: StackId, LayerId, or InstanceId.</p> <p>Valid Statistics: Average, Minimum, Maximum, Sum, or Data Samples.</p> <p>Unit: None</p>
memory_cached	<p>The amount of cached memory.</p> <p>Valid Dimensions: The IDs of the individual resources for which you are viewing metrics: StackId, LayerId, or InstanceId.</p> <p>Valid Statistics: Average, Minimum, Maximum, Sum, or Data Samples.</p> <p>Unit: None</p>
memory_free	<p>The amount of free memory.</p> <p>Valid Dimensions: The IDs of the individual resources for which you are viewing metrics: StackId, LayerId, or InstanceId.</p> <p>Valid Statistics: Average, Minimum, Maximum, Sum, or Data Samples.</p> <p>Unit: None</p>

Metric	Description
memory_swap	<p>The amount of swap space.</p> <p>Valid Dimensions: The IDs of the individual resources for which you are viewing metrics: StackId, LayerId, or InstanceId.</p> <p>Valid Statistics: Average, Minimum, Maximum, Sum, or Data Samples.</p> <p>Unit: None</p>
memory_total	<p>The total amount of memory.</p> <p>Valid Dimensions: The IDs of the individual resources for which you are viewing metrics: StackId, LayerId, or InstanceId.</p> <p>Valid Statistics: Average, Minimum, Maximum, Sum, or Data Samples.</p> <p>Unit: None</p>
memory_used	<p>The amount of memory in use.</p> <p>Valid Dimensions: The IDs of the individual resources for which you are viewing metrics: StackId, LayerId, or InstanceId.</p> <p>Valid Statistics: Average, Minimum, Maximum, Sum, or Data Samples.</p> <p>Unit: None</p>

Load Metrics

Metric	Description
load_1	<p>The load averaged over a one-minute window.</p> <p>Valid Dimensions: The IDs of the individual resources for which you are viewing metrics: StackId, LayerId, or InstanceId.</p> <p>Valid Statistics: Average, Minimum, Maximum, Sum, or Data Samples.</p> <p>Unit: None</p>
load_5	<p>The load averaged over a five-minute window.</p> <p>Valid Dimensions: The IDs of the individual resources for which you are viewing metrics: StackId, LayerId, or InstanceId.</p> <p>Valid Statistics: Average, Minimum, Maximum, Sum, or Data Samples.</p>

Metric	Description
	Unit: None
load_15	<p>The load averaged over a 15-minute window.</p> <p>Valid Dimensions: The IDs of the individual resources for which you are viewing metrics: <code>StackId</code>, <code>LayerId</code>, or <code>InstanceId</code>.</p> <p>Valid Statistics: Average, Minimum, Maximum, Sum, or Data Samples.</p> <p>Unit: None</p>

Process Metrics

Metric	Description
procs	<p>The number of active processes.</p> <p>Valid Dimensions: The IDs of the individual resources for which you are viewing metrics: <code>StackId</code>, <code>LayerId</code>, or <code>InstanceId</code>.</p> <p>Valid Statistics: Average, Minimum, Maximum, Sum, or Data Samples.</p> <p>Unit: None</p>

Dimensions for AWS OpsWorks Metrics

AWS OpsWorks data can be filtered along any of the following dimensions in the table below.

Dimension	Description
<code>StackId</code>	Average values for a stack.
<code>LayerId</code>	Average values for a layer.
<code>InstanceId</code>	Average values for an instance.

Amazon Polly Metrics

Amazon Polly sends metrics to CloudWatch. For more information, see the *Amazon Polly Developer Guide*.

Amazon Polly Metrics

Amazon Polly produces the following metrics for each request. These metrics are aggregated and in one minute intervals sent to CloudWatch where they are available in the `AWS/Polly` namespace.

Metric	Description
RequestCharacters	<p>The number of characters in the request. This is billable characters only and does not include SSML tags.</p> <p>Valid Dimension: Operation</p> <p>Valid Statistics: Minimum, Maximum, Average, SampleCount, Sum</p> <p>Unit: Count</p>
ResponseLatency	<p>The latency between when the request was made and the start of the streaming response.</p> <p>Valid Dimensions: Operation</p> <p>Valid Statistics: Minimum, Maximum, Average, SampleCount</p> <p>Unit: milliseconds</p>
2XXCount	<p>HTTP 200 level code returned upon a successful response.</p> <p>Valid Dimensions: Operation</p> <p>Valid Statistics: Average, SampleCount, Sum</p> <p>Unit: Count</p>
4XXCount	<p>HTTP 400 level error code returned upon an error. For each successful response, a zero (0) is emitted.</p> <p>Valid Dimensions: Operation</p> <p>Valid Statistics: Average, SampleCount, Sum</p> <p>Unit: Count</p>
5XXCount	<p>HTTP 500 level error code returned upon an error. For each successful response, a zero (0) is emitted.</p> <p>Valid Dimensions: Operation</p> <p>Valid Statistics: Average, SampleCount, Sum</p> <p>Unit: Count</p>

Dimensions for Amazon Polly Metrics

Amazon Polly provides metrics for the following dimension.

Dimension	Description
Operation	Metrics are grouped by the API method they refer to. Possible values are SynthesizeSpeech, PutLexicon, DescribeVoices, etc.

Amazon Redshift Metrics and Dimensions

Amazon Redshift sends metrics to CloudWatch for each active cluster every minute. Detailed monitoring is enabled by default. For more information, see [Monitoring Amazon Redshift Cluster Performance](#) in the *Amazon Redshift Cluster Management Guide*.

Amazon Redshift Metrics

The `AWS/Redshift` namespace includes the following metrics.

Metric	Description
CPUUtilization	<p>The percentage of CPU utilization. For clusters, this metric represents an aggregation of all nodes (leader and compute) CPU utilization values.</p> <p>Units: Percent</p> <p>Dimensions: NodeID, ClusterIdentifier</p>
DatabaseConnections	<p>The number of database connections to a cluster.</p> <p>Units: Count</p> <p>Dimensions: ClusterIdentifier</p>
HealthStatus	<p>Indicates the health of the cluster. Every minute the cluster connects to its database and performs a simple query. If it is able to perform this operation successfully, the cluster is considered healthy. Otherwise, the cluster is unhealthy. An unhealthy status can occur when the cluster database is under extremely heavy load or if there is a configuration problem with a database on the cluster. The exception to this is when the cluster is undergoing maintenance. Even though your cluster might be unavailable due to maintenance tasks, the cluster remains in HEALTHY state. For more information, see Maintenance Windows in the <i>Amazon Redshift Cluster Management Guide</i>.</p> <p>Note</p> <p>In Amazon CloudWatch this metric is reported as 1 or 0 whereas in the Amazon CloudWatch console, this metric is displayed with the words HEALTHY or UNHEALTHY for convenience. When this metric is displayed in the Amazon CloudWatch console, sampling averages are ignored and only HEALTHY or UNHEALTHY are displayed. In Amazon CloudWatch, values different than 1 and 0 may occur because of sampling issue. Any value below 1 for HealthStatus is reported as 0 (UNHEALTHY).</p>

Metric	Description
	<p>Units: 1/0 (HEALTHY/UNHEALTHY in the Amazon CloudWatch console)</p> <p>Dimensions: ClusterIdentifier</p>
MaintenanceMode	<p>Indicates whether the cluster is in maintenance mode.</p> <p>Note In Amazon CloudWatch this metric is reported as 1 or 0 whereas in the Amazon CloudWatch console, this metric is displayed with the words ON or OFF for convenience. When this metric is displayed in the Amazon CloudWatch console, sampling averages are ignored and only ON or OFF are displayed. In Amazon CloudWatch, values different than 1 and 0 may occur because of sampling issues. Any value greater than 0 for MaintenanceMode is reported as 1 (ON).</p> <p>Units: 1/0 (ON/OFF in the Amazon CloudWatch console).</p> <p>Dimensions: ClusterIdentifier</p>
NetworkReceiveThroughput	<p>The rate at which the node or cluster receives data.</p> <p>Units: Bytes/seconds (MB/s in the Amazon CloudWatch console)</p> <p>Dimensions: NodeID, ClusterIdentifier</p>
NetworkTransmitThroughput	<p>The rate at which the node or cluster writes data.</p> <p>Units: Bytes/second (MB/s in the Amazon CloudWatch console)</p> <p>Dimensions: NodeID, ClusterIdentifier</p>
PercentageDiskSpaceUsed	<p>The percent of disk space used.</p> <p>Units: Percent</p> <p>Dimensions: NodeID, ClusterIdentifier</p>
ReadIOPS	<p>The average number of disk read operations per second.</p> <p>Units: Count/second</p> <p>Dimensions: NodeID</p>
ReadLatency	<p>The average amount of time taken for disk read I/O operations.</p> <p>Units: Seconds</p> <p>Dimensions: NodeID</p>
ReadThroughput	<p>The average number of bytes read from disk per second.</p> <p>Units: Bytes (GB/s in the Amazon CloudWatch console)</p> <p>Dimensions: NodeID</p>

Metric	Description
WriteIOPS	The average number of write operations per second during the polling period. Units: Count/seconds Dimensions: NodeID
WriteLatency	The average amount of time taken for disk write I/O operations. Units: Seconds Dimensions: NodeID
WriteThroughput	The average number of bytes written to disk per second. Units: Bytes (GB/s in the Amazon CloudWatch console) Dimensions: NodeID

Dimensions for Amazon Redshift Metrics

Amazon Redshift data can be filtered along any of the following dimensions in the table below.

Dimension	Description
NodeID	Filters requested data that is specific to the nodes of a cluster. NodeID will be either "Leader", "Shared", or "Compute-N" where N is 0, 1, ... for the number of nodes in the cluster. "Shared" means that the cluster has only one node, i.e. the leader node and compute node are combined. Metrics are reported for the leader node and compute nodes only for CPUUtilization, NetworkTransmitThroughput, and ReadIOPS. Other metrics that use the NodeID dimension are reported only for compute nodes.
ClusterIdentifier	Filters requested data that is specific to the cluster. Metrics that are specific to clusters include HealthStatus, MaintenanceMode, and DatabaseConnections. In general metrics in for this dimension (e.g. ReadIOPS) that are also metrics of nodes represent an aggregate of the node metric data. You should take care in interpreting these metrics because they aggregate behavior of leader and compute nodes.

Amazon RDS Metrics and Dimensions

Amazon Relational Database Service sends metrics to CloudWatch for each active database instance every minute. Detailed monitoring is enabled by default. For more information, see [Monitoring a DB Instance](#) in the *Amazon Relational Database Service User Guide*.

Amazon RDS Metrics

The AWS/RDS namespace includes the following metrics.

Metric	Description
BinLogDiskUsage	<p>The amount of disk space occupied by binary logs on the master. Applies to MySQL read replicas.</p> <p>Units: Bytes</p>
BurstBalance	<p>The percent of General Purpose SSD (gp2) burst-bucket I/O credits available.</p> <p>Units: Percent</p>
CPUUtilization	<p>The percentage of CPU utilization.</p> <p>Units: Percent</p>
CPUCreditUsage	<p>[T2 instances] The number of CPU credits spent by the instance for CPU utilization. One CPU credit equals one vCPU running at 100% utilization for one minute or an equivalent combination of vCPUs, utilization, and time (for example, one vCPU running at 50% utilization for two minutes or two vCPUs running at 25% utilization for two minutes).</p> <p>CPU credit metrics are available at a five-minute frequency only. If you specify a period greater than five minutes, use the <code>Sum</code> statistic instead of the <code>Average</code> statistic.</p> <p>Units: Credits (vCPU-minutes)</p>
CPUCreditBalance	<p>[T2 instances] The number of earned CPU credits that an instance has accrued since it was launched or started. For T2 Standard, the <code>CPUCreditBalance</code> also includes the number of launch credits that have been accrued.</p> <p>Credits are accrued in the credit balance after they are earned, and removed from the credit balance when they are spent. The credit balance has a maximum limit, determined by the instance size. Once the limit is reached, any new credits that are earned are discarded. For T2 Standard, launch credits do not count towards the limit.</p> <p>The credits in the <code>CPUCreditBalance</code> are available for the instance to spend to burst beyond its baseline CPU utilization.</p> <p>When an instance is running, credits in the <code>CPUCreditBalance</code> do not expire. When the instance stops, the <code>CPUCreditBalance</code> does not persist, and all accrued credits are lost.</p> <p>CPU credit metrics are available at a five-minute frequency only.</p> <p>Units: Credits (vCPU-minutes)</p>
CPUSurplusCreditBalance	<p>[T2 Unlimited instances] The number of surplus credits that have been spent by a T2 Unlimited instance when its <code>CPUCreditBalance</code> is zero.</p> <p>The <code>CPUSurplusCreditBalance</code> is paid down by earned CPU credits. If the number of surplus credits exceeds the maximum number of credits the instance can earn in a 24-hour period, the spent surplus credits above the maximum incur an additional charge.</p>

Metric	Description
	Units: Credits (vCPU-minutes)
CPUSurplusCreditsCharged	<p>[T2 Unlimited instances] The number of spent surplus credits that are not paid down by earned CPU credits, and thus incur an additional charge.</p> <p>Spent surplus credits are charged when any of the following occurs:</p> <ul style="list-style-type: none"> • The spent surplus credits exceed the maximum number of credits the instance can earn in a 24-hour period. Spent surplus credits above the maximum are charged at the end of the hour. • The instance is stopped or terminated. • The instance is switched from Unlimited to Standard. <p>Units: Credits (vCPU-minutes)</p>
DatabaseConnections	<p>The number of database connections in use.</p> <p>Units: Count</p>
DiskQueueDepth	<p>The number of outstanding IOs (read/write requests) waiting to access the disk.</p> <p>Units: Count</p>
FreeableMemory	<p>The amount of available random access memory.</p> <p>Units: Bytes</p>
FreeStorageSpace	<p>The amount of available storage space.</p> <p>Units: Bytes</p>
MaximumUsedTransactionIDs	<p>The maximum transaction ID that has been used. Applies to PostgreSQL.</p> <p>Units: Count</p>
NetworkReceiveThroughput	<p>The incoming (Receive) network traffic on the DB instance, including both customer database traffic and Amazon RDS traffic used for monitoring and replication.</p> <p>Units: Bytes/second</p>
NetworkTransmitThroughput	<p>The outgoing (Transmit) network traffic on the DB instance, including both customer database traffic and Amazon RDS traffic used for monitoring and replication.</p> <p>Units: Bytes/second</p>
OldestReplicationSlotLag	<p>The lagging size of the replica lagging the most in terms of WAL data received. Applies to PostgreSQL.</p> <p>Units: Megabytes</p>

Metric	Description
ReadIOPS	The average number of disk read I/O operations per second during the polling period. Units: Count/Second
ReadLatency	The average amount of time taken per disk I/O operation. Units: Seconds
ReadThroughput	The average number of bytes read from disk per second. Units: Bytes/Second
ReplicaLag	The amount of time a Read Replica DB instance lags behind the source DB instance. Applies to MySQL, MariaDB, and PostgreSQL Read Replicas. Units: Seconds
ReplicationSlotDiskUsage	The disk space used by replication slot files. Applies to PostgreSQL. Units: Megabytes
SwapUsage	The amount of swap space used on the DB instance. Units: Bytes
TransactionLogsDiskUsage	The disk space used by transaction logs. Applies to PostgreSQL. Units: Megabytes
TransactionLogsGeneration	The size of transaction logs generated per second. Applies to PostgreSQL. Units: Megabytes/second
WriteIOPS	The average number of write disk I/O operations per second. Units: Count/Second
WriteLatency	The average amount of time taken per disk I/O operation. Units: Seconds
WriteThroughput	The average number of bytes written to disk per second. Units: Bytes/Second

Amazon Aurora Metrics

The AWS/RDS namespace includes the following metrics that apply to database entities running on Amazon Aurora.

Metric	Description
ActiveTransactions	The average number of current transactions executing on an Aurora database instance per second.

Metric	Description
AuroraBinlogReplicaLag	<p>The amount of time a replica DB cluster running on Aurora with MySQL compatibility lags behind the source DB cluster.</p> <p>This metric reports the value of the <code>Seconds_Behind_Master</code> field of the MySQL <code>SHOW SLAVE STATUS</code> command. This metric is useful for monitoring replica lag between Aurora DB clusters that are replicating across different AWS Regions. For more information, see Aurora MySQL Replication.</p>
AuroraReplicaLag	For an Aurora Replica, the amount of lag when replicating updates from the primary instance, in milliseconds.
AuroraReplicaLagMaximum	The maximum amount of lag between the primary instance and each Aurora DB instance in the DB cluster, in milliseconds.
AuroraReplicaLagMinimum	The minimum amount of lag between the primary instance and each Aurora DB instance in the DB cluster, in milliseconds.
BinLogDiskUsage	The amount of disk space occupied by binary logs on the master, in bytes.
BlockedTransactions	The average number of transactions in the database that are blocked per second.
BufferCacheHitRatio	The percentage of requests that are served by the buffer cache.
CommitLatency	The amount of latency for commit operations, in milliseconds.
CommitThroughput	The average number of commit operations per second.
CPUCreditBalance	<p>The number of CPU credits that an instance has accumulated. This metric applies only to <code>db.t2.small</code> and <code>db.t2.medium</code> instances. It is used to determine how long an Aurora MySQL DB instance can burst beyond its baseline performance level at a given rate.</p> <p>Note CPU credit metrics are reported at 5-minute intervals.</p>
CPUCreditUsage	<p>The number of CPU credits consumed during the specified period. This metric applies only to <code>db.t2.small</code> and <code>db.t2.medium</code> instances. It identifies the amount of time during which physical CPUs have been used for processing instructions by virtual CPUs allocated to the Aurora MySQL DB instance.</p> <p>Note CPU credit metrics are reported at 5-minute intervals.</p>
CPUUtilization	The percentage of CPU used by an Aurora DB instance.
DatabaseConnections	The number of connections to an Aurora DB instance.
DDLLatency	The amount of latency for data definition language (DDL) requests, in milliseconds—for example, create, alter, and drop requests.
DDLThroughput	The average number of DDL requests per second.
Deadlocks	The average number of deadlocks in the database per second.
DeleteLatency	The amount of latency for delete queries, in milliseconds.
DeleteThroughput	The average number of delete queries per second.

Metric	Description
DiskQueueDepth	The number of outstanding read/write requests waiting to access the disk.
DMLLatency	The amount of latency for inserts, updates, and deletes, in milliseconds.
DMLThroughput	The average number of inserts, updates, and deletes per second.
EngineUptime	The amount of time that the instance has been running, in seconds.
FreeableMemory	The amount of available random access memory, in bytes.
FreeLocalStorage	<p>The amount of storage available for temporary tables and logs, in bytes.</p> <p>Unlike for other DB engines, for Aurora DB instances this metric reports the amount of storage available to each DB instance for temporary tables and logs. This value depends on the DB instance class (for pricing information, see the Amazon RDS product page). You can increase the amount of free storage space for an instance by choosing a larger DB instance class for your instance.</p>
InsertLatency	The amount of latency for insert queries, in milliseconds.
InsertThroughput	The average number of insert queries per second.
LoginFailures	The average number of failed login attempts per second.
MaximumUsedTransactionID	The ID of the oldest unvacuumed transaction ID, in transactions. If this value reaches 2,146,483,648 ($2^{31} - 1,000,000$), the database is forced into read-only mode, to avoid transaction ID wraparound. For more information, see Preventing Transaction ID Wraparound Failures in the PostgreSQL documentation.
NetworkReceiveThroughput	The amount of network throughput received from clients by each instance in the Aurora MySQL DB cluster, in bytes per second. This throughput doesn't include network traffic between instances in the Aurora DB cluster and the cluster volume.
NetworkThroughput	The amount of network throughput both received from and transmitted to clients by each instance in the Aurora MySQL DB cluster, in bytes per second. This throughput doesn't include network traffic between instances in the DB cluster and the cluster volume.
NetworkTransmitThroughput	The amount of network throughput sent to clients by each instance in the Aurora DB cluster, in bytes per second. This throughput doesn't include network traffic between instances in the DB cluster and the cluster volume.
Queries	The average number of queries executed per second.
ReadIOPS	<p>The average number of disk I/O operations per second.</p> <p>Aurora with PostgreSQL compatibility reports read and write IOPS separately, on 1-minute intervals.</p>
ReadLatency	The average amount of time taken per disk I/O operation.
ReadThroughput	The average number of bytes read from disk per second.
ResultSetCacheHitRate	The percentage of requests that are served by the Resultset cache.
SelectLatency	The amount of latency for select queries, in milliseconds.

Metric	Description
SelectThroughput	The average number of select queries per second.
SwapUsage	The amount of swap space used on the Aurora PostgreSQL DB instance.
TransactionLogsDiskUsage	The amount of disk space occupied by transaction logs on the Aurora PostgreSQL DB instance.
UpdateLatency	The amount of latency for update queries, in milliseconds.
UpdateThroughput	The average number of update queries per second.
VolumeBytesUsed	<p>The amount of storage used by your Aurora DB instance, in bytes.</p> <p>This value affects the cost of the Aurora DB cluster (for pricing information, see the Amazon RDS product page).</p>
VolumeReadIOPs	<p>The average number of billed read I/O operations from a cluster volume, reported at 5-minute intervals.</p> <p>Billed read operations are calculated at the cluster volume level, aggregated from all instances in the Aurora DB cluster, and then reported at 5-minute intervals. The value is calculated by taking the value of the Read operations metric over a 5-minute period. You can determine the amount of billed read operations per second by taking the value of the Billed read operations metric and dividing by 300 seconds. For example, if the Billed read operations returns 13,686, then the billed read operations per second is 45 (13,686 / 300 = 45.62).</p> <p>You accrue billed read operations for queries that request database pages that aren't in the buffer cache and therefore must be loaded from storage. You might see spikes in billed read operations as query results are read from storage and then loaded into the buffer cache.</p>
VolumeWriteIOPs	The average number of write disk I/O operations to the cluster volume, reported at 5-minute intervals.
WriteIOPS	<p>The average number of disk I/O operations per second.</p> <p>Aurora PostgreSQL reports read and write IOPS separately, on 1-minute intervals.</p>
WriteLatency	The average amount of time taken per disk I/O operation.
WriteThroughput	The average number of bytes written to disk per second.

Dimensions for RDS Metrics

Amazon RDS data can be filtered along any of the following dimensions in the table below.

Dimension	Description
DBInstanceIdentifier	This dimension filters the data you request for a specific database instance.
DBClusterIdentifier	This dimension filters the data you request for a specific Amazon Aurora DB cluster.

Dimension	Description
<code>DBClusterIdentifier</code> , <code>Role</code>	This dimension filters the data you request for a specific Amazon Aurora DB cluster, aggregating the metric by instance role (WRITER/READER). For example, you can aggregate metrics for all READER instances that belong to a cluster.
<code>DatabaseClass</code>	This dimension filters the data you request for all instances in a database class. For example, you can aggregate metrics for all instances that belong to the database class <code>db.m1.small</code>
<code>EngineName</code>	This dimension filters the data you request for the identified engine name only. For example, you can aggregate metrics for all instances that have the engine name <code>mysql</code> .

Route 53 Metrics and Dimensions

Route 53 sends metrics to CloudWatch. CloudWatch provides detailed monitoring of Route 53 by default. Route 53 sends one-minute metrics to CloudWatch. For more information, see [Monitoring Health Checks Using Amazon CloudWatch](#) in the *Amazon Route 53 Developer Guide*.

Note

To get Route 53 metrics using CloudWatch, you must choose US East (N. Virginia) as the region. Route 53 metrics are not available if you select any other region. You can also optionally specify a `Region` dimension. For more information, see [Dimensions for Route 53 Metrics](#) (p. 235).

Route 53 Metrics

The `AWS/Route53` namespace includes the following metrics.

Metric	Description
<code>ChildHealthCheckHealthyCount</code>	<p>For a calculated health check, the number of health checks that are healthy among the health checks that Route 53 is monitoring.</p> <p>Valid statistics: Average (recommended), Minimum, Maximum</p> <p>Units: Healthy health checks</p>
<code>ConnectionTime</code>	<p>The average time, in milliseconds, that it took Route 53 health checkers to establish a TCP connection with the endpoint. You can view <code>ConnectionTime</code> for a health check either across all regions or for a selected geographic region.</p> <p>Valid statistics: Average (recommended), Minimum, Maximum</p> <p>Units: Milliseconds</p>
<code>HealthCheckPercentageHealthy</code>	<p>The percentage of Route 53 health checkers that consider the selected endpoint to be healthy. You can view <code>HealthCheckPercentageHealthy</code> only across all regions; data is not available for a selected region.</p> <p>Valid statistics: Average, Minimum, Maximum</p> <p>Units: Percent</p>

Metric	Description
HealthCheckStatus	<p>The status of the health check endpoint that CloudWatch is checking. 1 indicates healthy, and 0 indicates unhealthy. You can view <code>HealthCheckStatus</code> only across all regions; data is not available for a selected region.</p> <p>Valid statistics: Minimum</p> <p>Units: none</p>
SSLHandshakeTime	<p>The average time, in milliseconds, that it took Route 53 health checkers to complete the SSL handshake. You can view <code>SSLHandshakeTime</code> for a health check either across all regions or for a selected geographic region.</p> <p>Valid statistics: Average (recommended), Minimum, Maximum</p> <p>Units: Milliseconds</p>
TimeToFirstByte	<p>The average time, in milliseconds, that it took Route 53 health checkers to receive the first byte of the response to an HTTP or HTTPS request. You can view <code>TimeToFirstByte</code> for a health check either across all regions or for a selected geographic region.</p> <p>Valid statistics: Average (recommended), Minimum, Maximum</p> <p>Units: Milliseconds</p>

Dimensions for Route 53 Metrics

Route 53 metrics use the `AWS/Route53` namespace and provide metrics for `HealthCheckId`. When retrieving metrics, you must supply the `HealthCheckId` dimension.

In addition, for `ConnectionTime`, `SSLHandshakeTime`, and `TimeToFirstByte`, you can optionally specify `Region`. If you omit `Region`, CloudWatch returns metrics across all regions. If you include `Region`, CloudWatch returns metrics only for the specified region.

For more information, see [Monitoring Health Checks Using CloudWatch](#) in the *Amazon Route 53 Developer Guide*.

Amazon SageMaker Metrics and Dimensions

Amazon SageMaker sends metrics to CloudWatch. For more information, see [Monitoring Amazon SageMaker with Amazon CloudWatch](#) in the *Amazon SageMaker Developer Guide*.

Invocation Metrics

The `AWS/SageMaker` namespace includes the following request metrics.

Metric	Description
ModelLatency	<p>The latency of the model's response, as viewed from Amazon SageMaker.</p> <p>Units: Microseconds</p>

Metric	Description
	Valid statistics: Average, Sum, Min, Max, Sample Count
Invocation4XXErrors	<p>The number of <code>InvokeEndpoint</code> requests where the model returned a 4xx HTTP response code. For each 4xx response, 1 is sent; otherwise, 0 is sent.</p> <p>Units: Count</p> <p>Valid statistics: Average, Sum</p>
Invocation5XXErrors	<p>The number of <code>InvokeEndpoint</code> requests where the model returned a 5xx HTTP response code. For each 5xx response, 1 is sent; otherwise, 0 is sent.</p> <p>Units: Count</p> <p>Valid statistics: Average, Sum</p>
Invocations	<p>The number of <code>InvokeEndpoint</code> requests sent to a model.</p> <p>To get the total number of requests to the endpoint variant, use the Sum statistic.</p> <p>Units: Count</p> <p>Valid statistics: Sum, Sample Count</p>
InvocationsPerInstance	<p>The number of invocations sent to a model, normalized by <code>InstanceCount</code> in each <code>ProductionVariant</code>. <code>1/numberOfInstances</code> is sent as the value on each request, where <code>numberOfInstances</code> is the number of active instances for the <code>ProductionVariant</code> behind the endpoint at the time of the request.</p> <p>Units: Count</p> <p>Valid statistics: Sum</p>

Dimensions for Invocation Metrics

Dimension	Description
EndpointName, VariantName	Filters invocation metrics for a <code>ProductionVariant</code> of the specified endpoint and variant.

Instance Metrics

The `/aws/sagemaker/Endpoints` and `/aws/sagemaker/TrainingJobs` namespaces include the following metrics.

Metric	Description
CPUUtilization	<p>The percentage of CPU units that are used by the containers on an instance. The value can range between 0 and 100, and is multiplied by the number of CPUs. For example, if there are four CPUs, <code>CPUUtilization</code> can range from 0% to 400%.</p> <p>For endpoint variants, the value is the sum of the CPU utilization of the primary and supplementary containers on the instance.</p>

Metric	Description
	<p>For training jobs, the value is the CPU utilization of the Algorithm container on the instance.</p> <p>Units: Percent</p> <p>Valid statistics: Max</p>
MemoryUtilization	<p>The percentage of memory that is used by the containers on an instance. This value can range between 0% and 100%.</p> <p>For endpoint variants, the value is the sum of the memory utilization of the primary and supplementary containers on the instance.</p> <p>For training jobs, the value is the memory utilization of the Algorithm container on the instance.</p> <p>Units: Percent</p> <p>Valid statistics: Max</p>
GPUUtilization	<p>The percentage of GPU units that are used by the containers on an instance. The value can range between 0 and 100 and is multiplied by the number of GPUs. For example, if there are four GPUs, GPUUtilization can range from 0% to 400%.</p> <p>For endpoint variants, the value is the sum of the GPU utilization of the primary and supplementary containers on the instance.</p> <p>For training jobs, the value is the GPU utilization of the Algorithm container on the instance.</p> <p>Units: Percent</p> <p>Valid statistics: Max</p>

Dimensions for Host Metrics

Dimension	Description
Host	<p>For endpoints, the value for this dimension has the format [endpoint-name]/[production-variant-name]/[instance-id]. Use this dimension to filter instance metrics for the specified endpoint, variant, and instance. This dimension format is present only in the /aws/sagemaker/Endpoints namespace.</p> <p>For training jobs, the value for this dimension has the format [training-job-name]/algo-[instance-number-in-cluster]. Use this dimension to filter instance metrics for the specified training job and instance. This dimension format is present only in the /aws/sagemaker/TrainingJobs namespace.</p>

Amazon Simple Email Service Metrics and Dimensions

Amazon Simple Email Service sends certain data points to CloudWatch. These data points track important metrics related to your email sending activities. For more information, see [Retrieving Amazon SES Event Data from CloudWatch](#) in the *Amazon Simple Email Service Developer Guide*.

Amazon SES Metrics

The following metrics are available from Amazon SES.

Metric	Description
Send	<p>The number of messages that Amazon SES accepted and attempted to send. This value may be distinct from the Delivery metric, because messages could bounce or be rejected by the email servers that receive them.</p> <p>Unit: Count</p>
Reject	<p>The number of messages that Amazon SES did not send because they contained viruses or malicious content. Amazon SES may initially accept a message that contains a virus, but as soon as it detects the virus, it stops processing the message. When Amazon SES rejects a message, it doesn't attempt to deliver the message to the recipient's mail server.</p> <p>Unit: Count</p>
Bounce	<p>The number of emails that resulted in a hard bounce. A hard bounce occurs when an email is permanently rejected by the recipient's mail server.</p> <p>Unit: Count</p>
Complaint	<p>The number of emails that were marked by their recipients as spam.</p> <p>Unit: Count</p>
Delivery	<p>The number of emails that Amazon SES successfully delivered to the mail servers of the intended recipients.</p> <p>Unit: Count</p>
Open	<p>The number of emails that were opened by their recipients. Amazon SES only tracks this metric when you use a configuration set that publishes Open events. Additionally, Amazon SES only captures Open events for HTML emails.</p> <p>Unit: Count</p>
Click	<p>The number of emails in which the recipient clicked a link. Amazon SES only tracks this metric when you use a configuration set that publishes Click events.</p>

Metric	Description
	Additionally, Amazon SES only captures Click events for HTML emails. Unit: Count
Rendering Failure	The number of emails that weren't able to be sent because they contained template rendering issues. This event type only occurs when you send templated email using the <code>SendTemplatedEmail</code> or <code>SendBulkTemplatedEmail</code> API operations. This event type can occur when template data is missing, or when there is a mismatch between template parameters and data. Unit: Count
Reputation.BounceRate	The percentage of messages that resulted in hard bounces. To calculate the percentage of emails that bounced, multiply <code>Reputation.BounceRate</code> by 100. Unit: Percent
Reputation.ComplaintRate	The percentage of messages that were reported as spam by their recipients. To calculate the percentage of emails that resulted in complaints, multiply <code>Reputation.ComplaintRate</code> by 100. Unit: Percent

Dimensions for Amazon SES Metrics

CloudWatch uses the dimension names that you specify when you add a CloudWatch event destination to a configuration set in Amazon SES. For more information, see [Set Up a CloudWatch Event Destination for Amazon SES Event Publishing](#).

Amazon Simple Notification Service Metrics and Dimensions

Amazon Simple Notification Service sends data points to CloudWatch for several metrics. All active topics automatically send five-minute metrics to CloudWatch. Detailed monitoring, or one-minute metrics, is currently unavailable for Amazon Simple Notification Service. A topic stays active for six hours from the last activity (for example, any API call) on the topic. For more information, see [Monitoring Amazon SNS with Amazon CloudWatch](#) in the *Amazon Simple Notification Service Developer Guide*.

Amazon Simple Notification Service Metrics

The `AWS/SNS` namespace includes the following metrics.

Metric	Description
<code>NumberOfMessagesPublished</code>	The number of messages published.

Metric	Description
	Units: Count Valid Statistics: Sum
PublishSize	The size of messages published. Units: Bytes Valid Statistics: Minimum, Maximum, Average and Count
NumberOfNotificationsDelivered	The number of messages successfully delivered. Units: Count Valid Statistics: Sum
NumberOfNotificationsFailed	The number of messages that Amazon SNS failed to deliver. This metric is applied after Amazon SNS stops attempting message deliveries to Amazon SQS, email, SMS, or mobile push endpoints. Each delivery attempt to an HTTP or HTTPS endpoint adds 1 to the metric. For all other endpoints, the count increases by 1 when the message is not delivered (regardless of the number of attempts). You can control the number of retries for HTTP endpoints; for more information, see Setting Amazon SNS Delivery Retry Policies for HTTP/HTTPS Endpoints . Units: Count Valid Statistics: Sum, Average
SMSSuccessRate	The rate of successful SMS message deliveries. Units: Count Valid Statistics: Sum, Average, Data Samples

Dimensions for Amazon Simple Notification Service Metrics

Amazon SNS sends the following dimensions to CloudWatch.

Dimension	Description
Application	Filters on application objects, which represent an app and device registered with one of the supported push notification services, such as APNS and GCM.
Application,Platform	Filters on application and platform objects, where the platform objects are for the supported push notification services, such as APNS and GCM.
Country	Filters on the destination country of an SMS message. The country is represented by its ISO 3166-1 alpha-2 code.

Dimension	Description
Platform	Filters on platform objects for the push notification services, such as APNS and GCM.
TopicName	Filters on Amazon SNS topic names.
SMSType	Filters on the message type of SMS message. Can be <i>promotional</i> or <i>transactional</i> .

Amazon SQS Metrics and Dimensions

Amazon SQS sends data points to CloudWatch for several metrics. All active queues automatically send five-minute metrics to CloudWatch. A queue stays active for six hours from the last activity (for example, any API call) on the queue. For more information, see [Monitoring Amazon SQS with Amazon CloudWatch](#) in the *Amazon Simple Queue Service Developer Guide*.

Note

Detailed monitoring, or one-minute metrics, is currently unavailable for Amazon SQS. Making requests to CloudWatch at this resolution might return no data.

Amazon SQS Metrics

The AWS/SQS namespace includes the following metrics.

Metric	Description
ApproximateAgeOfOldestMessage	<p>The approximate age of the oldest non-deleted message in the queue.</p> <p>Units: <i>Seconds</i></p> <p>Valid Statistics: Average, Minimum, Maximum, Sum, Data Samples (displays as Sample Count in the Amazon SQS console)</p>
ApproximateNumberOfMessagesDelayed	<p>The number of messages in the queue that are delayed and not available for reading immediately. This can happen when the queue is configured as a delay queue or when a message has been sent with a delay parameter.</p> <p>Units: <i>Count</i></p> <p>Valid Statistics: Average, Minimum, Maximum, Sum, Data Samples (displays as Sample Count in the Amazon SQS console)</p>
ApproximateNumberOfMessagesNotVisible	<p>The number of messages that are "in flight." Messages are considered in flight if they have been sent to a client but have not yet been deleted or have not yet reached the end of their visibility window.</p> <p>Units: <i>Count</i></p>

Metric	Description
	Valid Statistics: Average, Minimum, Maximum, Sum, Data Samples (displays as Sample Count in the Amazon SQS console)
ApproximateNumberOfMessagesVisible	<p>The number of messages available for retrieval from the queue.</p> <p>Units: <i>Count</i></p> <p>Valid Statistics: Average, Minimum, Maximum, Sum, Data Samples (displays as Sample Count in the Amazon SQS console)</p>
NumberOfEmptyReceives	<p>The number of ReceiveMessage API calls that did not return a message.</p> <p>Units: <i>Count</i></p> <p>Valid Statistics: Average, Minimum, Maximum, Sum, Data Samples (displays as Sample Count in the Amazon SQS console)</p>
NumberOfMessagesDeleted	<p>The number of messages deleted from the queue.</p> <p>Units: <i>Count</i></p> <p>Valid Statistics: Average, Minimum, Maximum, Sum, Data Samples (displays as Sample Count in the Amazon SQS console)</p> <p>Amazon SQS emits the <code>NumberOfMessagesDeleted</code> metric for every successful deletion operation that uses a valid receipt handle, including duplicate deletions. The following scenarios might cause the value of the <code>NumberOfMessagesDeleted</code> metric to be higher than expected:</p> <ul style="list-style-type: none"> Calling the <code>DeleteMessage</code> action on different receipt handles that belong to the same message: If the message is not processed before the visibility timeout expires, the message becomes available to other consumers that can process it and delete it again, increasing the value of the <code>NumberOfMessagesDeleted</code> metric. Calling the <code>DeleteMessage</code> action on the same receipt handle: If the message is processed and deleted but you call the <code>DeleteMessage</code> action again using the same receipt handle, a success status is returned, increasing the value of the <code>NumberOfMessagesDeleted</code> metric.

Metric	Description
<code>NumberOfMessagesReceived</code>	<p>The number of messages returned by calls to the <code>ReceiveMessage</code> API action.</p> <p>Units: <i>Count</i></p> <p>Valid Statistics: Average, Minimum, Maximum, Sum, Data Samples (displays as Sample Count in the Amazon SQS console)</p>
<code>NumberOfMessagesSent</code>	<p>The number of messages added to a queue.</p> <p>Units: <i>Count</i></p> <p>Valid Statistics: Average, Minimum, Maximum, Sum, Data Samples (displays as Sample Count in the Amazon SQS console)</p>
<code>SentMessageSize</code>	<p>The size of messages added to a queue.</p> <p>Units: <i>Bytes</i></p> <p>Valid Statistics: Average, Minimum, Maximum, Sum, Data Samples (displays as Sample Count in the Amazon SQS console)</p> <p>Note that <code>SentMessageSize</code> does not display as an available metric in the CloudWatch console until at least one message is sent to the corresponding queue.</p>

Dimensions for Amazon SQS Metrics

The only dimension that Amazon SQS sends to CloudWatch is `queueName`. This means that all available statistics are filtered by `queueName`.

Amazon Simple Storage Service Metrics and Dimensions

Amazon Simple Storage Service sends data points to CloudWatch for several metrics, such as object counts and bytes stored, once a day. For more information, see [Monitoring Amazon S3 with CloudWatch](#) in the *Amazon Simple Storage Service Developer Guide*.

Amazon S3 CloudWatch Metrics

The `AWS/S3` namespace includes the following daily storage metrics for buckets.

Metric	Description
<code>BucketSizeBytes</code>	The amount of data in bytes stored in a bucket in the Standard storage class, Standard - Infrequent Access (Standard_IA) storage class, or the Reduced Redundancy Storage (RRS) storage class.

Metric	Description
	<p>Valid storage type filters: <code>StandardStorage</code>, or <code>StandardIAStorage</code>, or <code>ReducedRedundancyStorage</code> (see <code>StorageType</code> dimension)</p> <p>Units: Bytes</p> <p>Valid statistics: Average</p>
<code>NumberOfObjects</code>	<p>The total number of objects stored in a bucket for all storage classes except for the <code>GLACIER</code> storage class.</p> <p>Valid storage type filters: <code>AllStorageTypes</code> only (see <code>StorageType</code> dimension)</p> <p>Units: Count</p> <p>Valid statistics: Average</p>

The `AWS/S3` namespace includes the following request metrics.

Metric	Description
<code>AllRequests</code>	<p>The total number of HTTP requests made to a bucket, regardless of type. If you use a metrics configuration with a filter, this metric returns only the HTTP requests made to the objects in the bucket that meet the filter requirements.</p> <p>Units: Count</p> <p>Valid statistics: Sum</p>
<code>GetRequests</code>	<p>The number of HTTP GET requests made for objects in a bucket. This doesn't include list operations.</p> <p>Paginated list-oriented requests, such as List Multipart Uploads, List Parts, Get Bucket Object Versions, and others, are not included in this metric.</p> <p>Units: Count</p> <p>Valid statistics: Sum</p>
<code>PutRequests</code>	<p>The number of HTTP PUT requests made for objects in a bucket.</p> <p>Units: Count</p> <p>Valid statistics: Sum</p>
<code>DeleteRequests</code>	<p>The number of HTTP DELETE requests made for objects in a bucket. This also includes Delete Multiple Objects requests.</p> <p>Units: Count</p> <p>Valid statistics: Sum</p>
<code>HeadRequests</code>	<p>The number of HTTP HEAD requests made to a bucket.</p> <p>Units: Count</p>

Metric	Description
	Valid statistics: Sum
PostRequests	<p>The number of HTTP POST requests made to a bucket.</p> <p>Units: Count</p> <p>Valid statistics: Sum</p>
ListRequests	<p>The number of HTTP requests that list the contents of a bucket.</p> <p>Units: Count</p> <p>Valid statistics: Sum</p>
BytesDownloaded	<p>The number bytes downloaded for requests made to a bucket, where the response includes a body.</p> <p>Units: Bytes</p> <p>Valid statistics: Average (bytes per request), Sum (bytes per period), Sample Count, Min, Max</p>
BytesUploaded	<p>The number bytes uploaded to a bucket that contain a request body.</p> <p>Units: Bytes</p> <p>Valid statistics: Average (bytes per request), Sum (bytes per period), Sample Count, Min, Max</p>
4xxErrors	<p>The number of HTTP 4xx client error status code requests made to a bucket with a value of 0 or 1. The <code>average</code> statistic shows the error rate, and the <code>sum</code> statistic shows the count of that type of error, during each period.</p> <p>Units: Count</p> <p>Valid statistics: Average (reports per request), Sum (reports per period), Min, Max, Sample Count</p>
5xxErrors	<p>The number of HTTP 5xx server error status code requests made to a bucket with a value of either 0 or 1. The <code>average</code> statistic shows the error rate, and the <code>sum</code> statistic shows the count of that type of error, during each period.</p> <p>Units: Counts</p> <p>Valid statistics: Average (reports per request), Sum (reports per period), Min, Max, Sample Count</p>
FirstByteLatency	<p>The per-request time from the complete request being received by a bucket to when the response starts to be returned.</p> <p>Units: Milliseconds</p> <p>Valid statistics: Average, Sum, Min, Max, Sample Count</p>

Metric	Description
TotalRequestLatency	<p>The elapsed per-request time from the first byte received to the last byte sent to a bucket. This includes the time taken to receive the request body and send the response body, which is not included in FirstByteLatency.</p> <p>Units: Milliseconds</p> <p>Valid statistics: Average, Sum, Min, Max, Sample Count</p>

Amazon S3 CloudWatch Dimensions

The following dimensions are used to filter Amazon S3 metrics.

Dimension	Description
BucketName	Filters the data you request for the identified bucket only.
StorageType	Filters the data stored in a bucket by the type of storage. The types are StandardStorage for the Standard storage class, StandardIAStorage for the Standard_IA storage class, ReducedRedundancyStorage for the Reduced Redundancy Storage (RRS) class, and AllStorageTypes. Note that the AllStorageTypes type does not include the GLACIER storage class.
FilterId	Filters metrics configurations that you specify for request metrics on a bucket, for example, a prefix or a tag. You specify a filter ID when you create a metrics configuration.

AWS Shield Advanced Metrics

For information about the Shield Advanced metrics that you can use with CloudWatch, see [Shield Advanced Metrics](#) in the AWS WAF Developer Guide.

AWS Step Functions Metrics and Dimensions

The following metrics are available for AWS Step Functions. For more information, see [Monitoring Step Functions Using CloudWatch](#) in the *AWS Step Functions Developer Guide*.

Execution Metrics

The AWS/States namespace includes the following metrics for Step Functions executions:

Metric	Description
ExecutionTime	The interval, in milliseconds, between the time the execution starts and the time it closes.

Metric	Description
ExecutionThrottled	The number of <code>StateEntered</code> events and retries that have been throttled.
ExecutionsAborted	The number of aborted or terminated executions.
ExecutionsFailed	The number of failed executions.
ExecutionsStarted	The number of started executions.
ExecutionsSucceeded	The number of successfully completed executions.
ExecutionsTimedOut	The number of executions that time out for any reason.

Dimension for Step Functions Execution Metrics

Dimension	Description
StateMachineArn	The ARN of the state machine for the execution in question.

Activity Metrics

The `AWS/States` namespace includes the following metrics for Step Functions activities:

Metric	Description
ActivityRunTime	The interval, in milliseconds, between the time the activity starts and the time it closes.
ActivityScheduleTime	The interval, in milliseconds, for which the activity stays in the schedule state.
ActivityTime	The interval, in milliseconds, between the time the activity is scheduled and the time it closes.
ActivitiesFailed	The number of failed activities.
ActivitiesHeartbeatTimedOut	The number of activities that time out due to a heartbeat timeout.
ActivitiesScheduled	The number of scheduled activities.
ActivitiesStarted	The number of started activities.
ActivitiesSucceeded	The number of successfully completed activities.
ActivitiesTimedOut	The number of activities that time out on close.

Dimension for Step Functions Activity Metrics

Dimension	Description
ActivityArn	The ARN of the activity.

Lambda Function Metrics

The `AWS/States` namespace includes the following metrics for Step Functions Lambda functions:

Metric	Description
<code>LambdaFunctionRunTime</code>	The interval, in milliseconds, between the time the Lambda function starts and the time it closes.
<code>LambdaFunctionScheduleTime</code>	The interval, in milliseconds, for which the Lambda function stays in the schedule state.
<code>LambdaFunctionTime</code>	The interval, in milliseconds, between the time the Lambda function is scheduled and the time it closes.
<code>LambdaFunctionsFailed</code>	The number of failed Lambda functions.
<code>LambdaFunctionsHeartbeatTimeOut</code>	The number of Lambda functions that time out due to a heartbeat timeout.
<code>LambdaFunctionsScheduled</code>	The number of scheduled Lambda functions.
<code>LambdaFunctionsStarted</code>	The number of started Lambda functions.
<code>LambdaFunctionsSucceeded</code>	The number of successfully completed Lambda functions.
<code>LambdaFunctionsTimedOut</code>	The number of Lambda functions that time out on close.

Dimension for Step Functions Lambda Function Metrics

Dimension	Description
<code>LambdaFunctionArn</code>	The ARN of the Lambda function.

Amazon SWF Metrics and Dimensions

Amazon SWF sends data points to CloudWatch for several metrics. Some of the Amazon SWF metrics for CloudWatch are time intervals, always measured in milliseconds. These metrics generally correspond to stages of your workflow execution for which you can set workflow and activity timeouts, and have similar names. For example, the **DecisionTaskStartToCloseTime** metric measures the time it took for the decision task to complete after it began executing, which is the same time period for which you can set a **DecisionTaskStartToCloseTimeout** value.

Other Amazon SWF metrics report results as a count. For example, **WorkflowsCanceled**, records a result as either one or zero, indicating whether or not the workflow was canceled. A value of zero does not indicate that the metric was not reported, only that the condition described by the metric did not occur. For count metrics, minimum and maximum will always be either zero or one, but average will be a value ranging from zero to one. For more information, see [Viewing Amazon SWF Metrics for CloudWatch using the AWS Management Console](#); in the *Amazon Simple Workflow Service Developer Guide*.

Workflow Metrics

The `AWS/SWF` namespace includes the following metrics for Amazon SWF workflows:

Metric	Description
DecisionTaskScheduleToStartTime	The time interval, in milliseconds, between the time that the decision task was scheduled and the time it was picked up by a worker and started.
DecisionTaskStartToCloseTime	The time interval, in milliseconds, between the time that the decision task was started and the time it was closed.
DecisionTasksCompleted	The count of decision tasks that have been completed.
StartedDecisionTasksTimedOutOnClose	The count of decision tasks that started but timed out on closing.
WorkflowStartToCloseTime	The time, in milliseconds, between the time the workflow started and the time it closed.
WorkflowsCanceled	The count of workflows that were canceled.
WorkflowsCompleted	The count of workflows that completed.
WorkflowsContinuedAsNew	The count of workflows that continued as new.
WorkflowsFailed	the count of workflows that failed.
WorkflowsTerminated	the count of workflows that were terminated.
WorkflowsTimedOut	The count of workflows that timed out, for any reason.

Dimensions for Amazon SWF Workflow Metrics

Dimension	Description
Domain	The Amazon SWF domain that the workflow is running in.
WorkflowTypeName	The name of the workflow type for this workflow execution.
WorkflowTypeVersion	The version of the workflow type for this workflow execution.

Activity Metrics

The `AWS/SWF` namespace includes the following metrics for Amazon SWF activities:

Metric	Description
ActivityTaskScheduleToCloseTime	The time interval, in milliseconds, between the time when the activity was scheduled to when it closed.
ActivityTaskScheduleToStartTime	The time interval, in milliseconds, between the time when the activity task was scheduled and when it started.
ActivityTaskStartToCloseTime	The time interval, in milliseconds, between the time when the activity task started and when it was closed.
ActivityTasksCanceled	The count of activity tasks that were canceled.

Metric	Description
ActivityTasksCompleted	The count of activity tasks that completed.
ActivityTasksFailed	The count of activity tasks that failed.
ScheduledActivityTasksTimedOutOnClose	The count of activity tasks that were scheduled but timed out on close.
ScheduledActivityTasksTimedOutOnStart	The count of activity tasks that were scheduled but timed out on start.
StartedActivityTasksTimedOutOnClose	The count of activity tasks that were started but timed out on close.
StartedActivityTasksTimedOutOnHeartbeat	The count of activity tasks that were started but timed out due to a heartbeat timeout.

Dimensions for Amazon SWF Activity Metrics

Dimension	Description
Domain	The Amazon SWF domain that the activity is running in.
ActivityTypeName	The name of the activity type.
ActivityTypeVersion	The version of the activity type

AWS Storage Gateway Metrics and Dimensions

AWS Storage Gateway sends data points to CloudWatch for several metrics. All active queues automatically send five-minute metrics to CloudWatch. Detailed monitoring, or one-minute metrics, is currently unavailable for AWS Storage Gateway. For more information, see [Monitoring Your AWS Storage Gateway](#) in the *AWS Storage Gateway User Guide*.

AWS Storage Gateway Metrics

The `AWS/StorageGateway` namespace includes the following metrics.

You can use these metrics to get information about your gateways. Specify the `GatewayId` or `GatewayName` dimension for each metric to view the data for a gateway. Note that these metrics are measured in 5-minute intervals.

Metric	Description	Applies To..
CacheHitPercent	Percent of application reads served from the cache. The sample is taken at the end of the reporting period. Units: Percent	File, Cached volumes and Tape.
CachePercentUsed	Percent use of the gateway's cache storage. The sample is	File, Cached volumes and Tape.

Metric	Description	Applies To..
	<p>taken at the end of the reporting period.</p> <p>Units: Percent</p>	
CachePercentDirty	<p>Percent of the gateway's cache that has not been persisted to AWS. The sample is taken at the end of the reporting period.</p> <p>Units: Percent</p>	File, Cached volumes and Tape.
CloudBytesDownloaded	<p>The total number of compressed bytes that the gateway downloaded from AWS during the reporting period.</p> <p>Use this metric with the <code>Sum</code> statistic to measure throughput and with the <code>Samples</code> statistic to measure input/output operations per second (IOPS).</p> <p>Units: Bytes</p>	File, Cached volumes, Stored volumes and Tape.
CloudDownloadLatency	<p>The total number of milliseconds spent reading data from AWS during the reporting period.</p> <p>Use this metric with the <code>Average</code> statistic to measure latency.</p> <p>Units: Milliseconds</p>	File, Cached volumes, Stored volumes and Tape.
CloudBytesUploaded	<p>The total number of compressed bytes that the gateway uploaded to AWS during the reporting period.</p> <p>Use this metric with the <code>Sum</code> statistic to measure throughput and with the <code>Samples</code> statistic to measure IOPS.</p> <p>Units: Bytes</p>	File, Cached volumes, Stored volumes and Tape.
UploadBufferFree	<p>The total amount of unused space in the gateway's upload buffer. The sample is taken at the end of the reporting period.</p> <p>Units: Bytes</p>	Cached volumes and Tape.

Metric	Description	Applies To..
CacheFree	The total amount of unused space in the gateway's cache storage. The sample is taken at the end of the reporting period. Units: Bytes	File, Cached volumes, and Tape.
UploadBufferPercentUsed	Percent use of the gateway's upload buffer. The sample is taken at the end of the reporting period. Units: Percent	Cached volumes and Tape.
UploadBufferUsed	The total number of bytes being used in the gateway's upload buffer. The sample is taken at the end of the reporting period. Units: Bytes	Cached volumes and Tape.
CacheUsed	The total number of bytes being used in the gateway's cache storage. The sample is taken at the end of the reporting period. Units: Bytes	File, Cached volumes and Tape.
QueuedWrites	The number of bytes waiting to be written to AWS, sampled at the end of the reporting period for all volumes in the gateway. These bytes are kept in your gateway's working storage. Units: Bytes	File, Cached volumes, Stored volumes and Tape.
ReadBytes	The total number of bytes read from your on-premises applications in the reporting period for all volumes in the gateway. Use this metric with the <code>Sum</code> statistic to measure throughput and with the <code>Samples</code> statistic to measure IOPS. Units: Bytes	File, Cached volumes, Stored volumes and Tape.

Metric	Description	Applies To..
ReadTime	<p>The total number of milliseconds spent to do read operations from your on-premises applications in the reporting period for all volumes in the gateway.</p> <p>Use this metric with the <code>Average</code> statistic to measure latency.</p> <p>Units: Milliseconds</p>	File, Cached volumes, Stored volumes and Tape.
TotalCacheSize	<p>The total size of the cache in bytes. The sample is taken at the end of the reporting period.</p> <p>Units: Bytes</p>	File, Cached volumes, and Tape.
WriteBytes	<p>The total number of bytes written to your on-premises applications in the reporting period for all volumes in the gateway.</p> <p>Use this metric with the <code>Sum</code> statistic to measure throughput and with the <code>Samples</code> statistic to measure IOPS.</p> <p>Units: Bytes</p>	File, Cached volumes, Stored volumes and Tape.
WriteTime	<p>The total number of milliseconds spent to do write operations from your on-premises applications in the reporting period for all volumes in the gateway.</p> <p>Use this metric with the <code>Average</code> statistic to measure latency.</p> <p>Units: Milliseconds</p>	File, Cached volumes, Stored volumes and Tape.
TimeSinceLastRecoveryPoint	<p>The time since the last available recovery point. For more information, see Using Volume Recovery Points for Your Cached Volumes Setup</p> <p>Units: Seconds</p>	Cached volumes and Stored volumes.

Metric	Description	Applies To..
WorkingStorageFree	The total amount of unused space in the gateway's working storage. The sample is taken at the end of the reporting period. Units: Bytes	Stored volumes only.
WorkingStoragePercentUsed	Percent use of the gateway's upload buffer. The sample is taken at the end of the reporting period. Units: Percent	Stored volumes only.
WorkingStorageUsed	The total number of bytes being used in the gateway's upload buffer. The sample is taken at the end of the reporting period. Units: Bytes	Stored volumes only.

The following table describes the AWS Storage Gateway metrics that you can use to get information about your storage volumes. Specify the `VolumeId` dimension for each metric to view the data for a storage volume.

Metric	Description	Cached volumes	Stored volumes
CacheHitPercent	Percent of application read operations from the volume that are served from cache. The sample is taken at the end of the reporting period. When there are no application read operations from the volume, this metric reports 100 percent. Units: Percent	yes	no
CachePercentDirty	The volume's contribution to the overall percentage of the gateway's cache that has not been persisted to AWS. The sample is taken at the end of the reporting period. Use the <code>CachePercentDirty</code>	yes	no

Metric	Description	Cached volumes	Stored volumes
	<p>metric of the gateway to view the overall percentage of the gateway's cache that has not been persisted to AWS. For more information, see Monitoring Your Gateway.</p> <p>Units: Percent</p>		
CachePercentUsed	<p>The volume's contribution to the overall percent use of the gateway's cache storage. The sample is taken at the end of the reporting period.</p> <p>Use the <code>CachePercentUsed</code> metric of the gateway to view overall percent use of the gateway's cache storage. For more information, see Monitoring Your Gateway.</p> <p>Units: Percent</p>	yes	no
ReadBytes	<p>The total number of bytes read from your on-premises applications in the reporting period.</p> <p>Use this metric with the <code>Sum</code> statistic to measure throughput and with the <code>Samples</code> statistic to measure IOPS.</p> <p>Units: Bytes</p>	yes	yes

Metric	Description	Cached volumes	Stored volumes
ReadTime	<p>The total number of milliseconds spent to do read operations from your on-premises applications in the reporting period.</p> <p>Use this metric with the <code>Average</code> statistic to measure latency.</p> <p>Units: Milliseconds</p>	yes	yes
WriteBytes	<p>The total number of bytes written to your on-premises applications in the reporting period.</p> <p>Use this metric with the <code>Sum</code> statistic to measure throughput and with the <code>Samples</code> statistic to measure IOPS.</p> <p>Units: Bytes</p>	yes	yes
WriteTime	<p>The total number of milliseconds spent to do write operations from your on-premises applications in the reporting period.</p> <p>Use this metric with the <code>Average</code> statistic to measure latency.</p> <p>Units: Milliseconds</p>	yes	yes
QueuedWrites	<p>The number of bytes waiting to be written to AWS, sampled at the end of the reporting period.</p> <p>Units: Bytes</p>	yes	yes

The following table describes the Storage Gateway metrics that you can use to get information about your file shares.

Metric	Description
CacheHitPercent	<p>Percent of application read operations from the file shares that are served from cache. The sample is taken at the end of the reporting period.</p> <p>When there are no application read operations from the file share, this metric reports 100 percent.</p> <p>Units: Percent</p>
CachePercentDirty	<p>The file share's contribution to the overall percentage of the gateway's cache that has not been persisted to AWS. The sample is taken at the end of the reporting period.</p> <p>Use the CachePercentDirty metric of the gateway to view the overall percentage of the gateway's cache that has not been persisted to AWS. For more information, see Monitoring Your Gateway.</p> <p>Units: Percent</p>
CachePercentUsed	<p>The file share's contribution to the overall percent use of the gateway's cache storage. The sample is taken at the end of the reporting period.</p> <p>Use the CachePercentUsed metric of the gateway to view overall percent use of the gateway's cache storage. For more information, see Monitoring Your Gateway.</p> <p>Units: Percent</p>
ReadBytes	<p>The total number of bytes read from your on-premises applications in the reporting period for a file share.</p> <p>Use this metric with the Sum statistic to measure throughput and with the Samples statistic to measure IOPS.</p> <p>Units: Bytes</p>
ReadTime	<p>The total number of milliseconds spent to do read operations from your on-premises applications in the reporting period.</p> <p>Use this metric with the Average statistic to measure latency.</p> <p>Units: Milliseconds</p>
WriteBytes	<p>The total number of bytes written to your on-premises applications in the reporting period.</p>

Metric	Description
	Use this metric with the <code>Sum</code> statistic to measure throughput and with the <code>Samples</code> statistic to measure IOPS. Units: Bytes
<code>WriteTime</code>	The total number of milliseconds spent to do write operations from your on-premises applications in the reporting period. Use this metric with the <code>Average</code> statistic to measure latency. Units: Milliseconds

Dimensions for AWS Storage Gateway Metrics

The Amazon CloudWatch namespace for the AWS Storage Gateway service is `AWS/StorageGateway`. Data is available automatically in 5-minute periods at no charge.

Dimension	Description
<code>GatewayId</code> , <code>GatewayName</code>	These dimensions filter the data you request to gateway-specific metrics. You can identify a gateway to work by its <code>GatewayId</code> or its <code>GatewayName</code> . However, note that if the name of your gateway was changed for the time range that you are interested in viewing metrics, then you should use the <code>GatewayId</code> . Throughput and latency data of a gateway is based on all the volumes for the gateway. For information about working with gateway metrics, see Measuring Performance Between Your Gateway and AWS .
<code>VolumeId</code>	This dimension filters the data you request to volume-specific metrics. Identify a storage volume to work with by its <code>VolumeId</code> . For information about working with volume metrics, see Measuring Performance Between Your Application and Gateway .

AWS Trusted Advisor Metrics and Dimensions

Trusted Advisor sends metrics to CloudWatch. For more information, see [Creating Trusted Advisor Metrics in CloudWatch](#) in the *AWS Support User Guide*.

The `AWS/TrustedAdvisor` namespace includes the following metrics.

Trusted Advisor Check-Level Metrics

Metric	Description
<code>RedResources</code>	The number of resources identified by a Trusted Advisor check that are in a "red" (ERROR) state.

Metric	Description
YellowResources	The number of resources identified by a Trusted Advisor check that are in a "yellow" (WARN) state.

Trusted Advisor Category-Level Metrics

Metric	Description
GreenChecks	The number of Trusted Advisor checks in a "green" (OK) state.
RedChecks	The number of Trusted Advisor checks in a "red" (ERROR) state.
YellowChecks	The number of Trusted Advisor checks in a "yellow" (WARN) state.

Trusted Advisor Service-Level Metrics

Metric	Description
ServiceLimitUsage	The percentage of resource utilization against a service limit.

Dimensions for Check-Level Metrics

Dimension	Description
CheckName	The name of a Trusted Advisor check. For more information about checks, see Cost Optimization .

Dimensions for Category-Level Metrics

Dimension	Description
Category	The name of a Trusted Advisor check category. For more information about check categories, see Trusted Advisor Best Practices (Checks) .

Dimensions for Service Limit Metrics

Dimension	Description
Region	The region for a given service limit.
ServiceName	The name of a service.
ServiceLimit	The name of service limit. For more information about checks, see Service Limits Check Questions .

Amazon VPC NAT Gateway Metrics and Dimensions

NAT gateway metric data is provided at 1-minute frequency. For more information, see [Monitoring Your NAT Gateway with Amazon CloudWatch](#) in the *Amazon VPC User Guide*.

NAT Gateway Metrics

The following metrics are available from the NAT gateway service.

Metric	Description
PacketsOutToDestination	<p>The number of packets sent out through the NAT gateway to the destination.</p> <p>A value greater than zero indicates that there is traffic going to the internet from clients that are behind the NAT gateway. If the value for <code>PacketsOutToDestination</code> is less than the value for <code>PacketsInFromSource</code>, there may be data loss during NAT gateway processing.</p> <p>Unit: Count</p>
PacketsOutToSource	<p>The number of packets sent through the NAT gateway to the clients in your VPC.</p> <p>A value greater than zero indicates that there is traffic coming from the internet to clients that are behind the NAT gateway. If the value for <code>PacketsOutToSource</code> is less than the value for <code>PacketsInFromDestination</code>, there may be data loss during NAT gateway processing, or traffic being actively blocked by the NAT gateway.</p> <p>Unit: Count</p>
PacketsInFromSource	<p>The number of packets received by the NAT gateway from clients in your VPC.</p> <p>If the value for <code>PacketsOutToDestination</code> is less than the value for <code>PacketsInFromSource</code>, there may be data loss during NAT gateway processing.</p> <p>Unit: Count</p>
PacketsInFromDestination	<p>The number of packets received by the NAT gateway from the destination.</p> <p>If the value for <code>PacketsOutToSource</code> is less than the value for <code>PacketsInFromDestination</code>, there may be data loss during NAT gateway processing, or traffic being actively blocked by the NAT gateway.</p> <p>Unit: Count</p>

Metric	Description
BytesOutToDestination	<p>The number of bytes sent out through the NAT gateway to the destination.</p> <p>A value greater than zero indicates that there is traffic going to the internet from clients that are behind the NAT gateway. If the value for BytesOutToDestination is less than the value for BytesInFromSource, there may be data loss during NAT gateway processing.</p> <p>Unit: Bytes</p>
BytesOutToSource	<p>The number of bytes sent through the NAT gateway to the clients in your VPC.</p> <p>A value greater than zero indicates that there is traffic coming from the internet to clients that are behind the NAT gateway. If the value for BytesOutToSource is less than the value for BytesInFromDestination, there may be data loss during NAT gateway processing, or traffic being actively blocked by the NAT gateway.</p> <p>Units: Bytes</p>
BytesInFromSource	<p>The number of bytes received by the NAT gateway from clients in your VPC.</p> <p>If the value for BytesOutToDestination is less than the value for BytesInFromSource, there may be data loss during NAT gateway processing.</p> <p>Units: Bytes</p>
BytesInFromDestination	<p>The number of bytes received by the NAT gateway from the destination.</p> <p>If the value for BytesOutToSource is less than the value for BytesInFromDestination, there may be data loss during NAT gateway processing, or traffic being actively blocked by the NAT gateway.</p> <p>Units: Bytes</p>
ErrorPortAllocation	<p>The number of times the NAT gateway could not allocate a source port.</p> <p>A value greater than zero indicates that too many concurrent connections are open through the NAT gateway.</p> <p>Units: Count</p>

Metric	Description
ActiveConnectionCount	<p>The total number of concurrent active TCP connections through the NAT gateway.</p> <p>A value of zero indicates that there are no active connections through the NAT gateway.</p> <p>Units: Count</p>
ConnectionAttemptCount	<p>The number of connection attempts made through the NAT gateway.</p> <p>If the value for <code>ConnectionEstablishedCount</code> is less than the value for <code>ConnectionAttemptCount</code>, this indicates that clients behind the NAT gateway attempted to establish new connections for which there was no response.</p> <p>Unit: Count</p>
ConnectionEstablishedCount	<p>The number of connections established through the NAT gateway.</p> <p>If the value for <code>ConnectionEstablishedCount</code> is less than the value for <code>ConnectionAttemptCount</code>, this indicates that clients behind the NAT gateway attempted to establish new connections for which there was no response.</p> <p>Unit: Count</p>
IdleTimeoutCount	<p>The number of connections that transitioned from the active state to the idle state. An active connection transitions to idle if it was not closed gracefully and there was no activity for the last 350 seconds.</p> <p>A value greater than zero indicates that there are connections that have been moved to an idle state. If the value for <code>IdleTimeoutCount</code> increases, it may indicate that clients behind the NAT gateway are re-using stale connections.</p> <p>Unit: Count</p>
PacketsDropCount	<p>The number of packets dropped by the NAT gateway.</p> <p>A value greater than zero may indicate an ongoing transient issue with the NAT gateway. If this value is high, see the AWS service health dashboard.</p> <p>Units: Count</p>

Dimensions for NAT Gateway Metrics

You can filter the NAT gateway data using the following dimensions.

Dimension	Description
NatGatewayId	This dimension filters data by the NAT gateway ID.

Amazon VPC VPN Metrics and Dimensions

Amazon VPN sends data to CloudWatch as it becomes available. For more information, see [Monitoring with CloudWatch](#) in the *Amazon VPC User Guide*.

VPN Metrics

The following metrics are available from Amazon VPC VPN.

Metric	Description
TunnelState	The state of the tunnel. 0 indicates DOWN and 1 indicates UP. Units: Boolean
TunnelDataIn	The bytes received through the VPN tunnel. Each metric data point represents the number of bytes received after the previous data point. Use the Sum statistic to show the total number of bytes received during the period. This metric counts the data after decryption. Units: Bytes
TunnelDataOut	The bytes sent through the VPN tunnel. Each metric data point represents the number of bytes sent after the previous data point. Use the Sum statistic to show the total number of bytes sent during the period. This metric counts the data before encryption. Units: Bytes

Dimensions for VPN Metrics

You can filter the Amazon VPC VPN data using the following dimensions.

Dimension	Description
VpnId	This dimension filters the data by the VPN connection.
TunnelIpAddress	This dimension filters the data by the IP address of the tunnel for the virtual private gateway.

AWS WAF Metrics and Dimensions

AWS WAF sends data to CloudWatch every minute. For more information, see [Testing Web ACLs](#) in the *AWS WAF Developer Guide*.

AWS WAF Metrics

The WAF namespace includes the following metrics.

Metric	Description
AllowedRequests	The number of allowed web requests. Reporting criteria: There is a nonzero value Valid statistics: Sum
BlockedRequests	The number of blocked web requests. Reporting criteria: There is a nonzero value Valid statistics: Sum
CountedRequests	The number of counted web requests. Reporting criteria: There is a nonzero value A counted web request is one that matches all of the conditions in a particular rule. Counted web requests are typically used for testing. Valid statistics: Sum
PassedRequests	The number of passed requests for a rule group. Reporting criteria: There is a nonzero value Passed requests are requests that did not match any rule contained in the rule group. Valid statistics: Sum

AWS WAF Dimensions

AWS WAF for CloudFront can use the following dimension combinations:

- Rule, WebACL
- RuleGroup, WebACL
- Rule, RuleGroup

AWS WAF for Application Load Balancer can use the following dimension combinations:

- Region, Rule, WebACL
- Region, RuleGroup, WebACL
- Region, Rule, RuleGroup

Dimension	Description
Rule	One of the following: <ul style="list-style-type: none"> The metric name of the Rule. ALL, which represents all rules within a WebACL or RuleGroup. Default_Action (only when combined with the WebACL dimension), which represents the action assigned to any request that does not match any rule with either an allow or block action.
RuleGroup	The metric name of the RuleGroup.
WebACL	The metric name of the WebACL.
Region	The region of the application load balancer.

Amazon WorkSpaces Metrics and Dimensions

Amazon WorkSpaces sends data points to CloudWatch for several metrics every five minutes (five-minute metrics). Detailed monitoring, or one-minute metrics, is currently unavailable for Amazon WorkSpaces. For more information, see [Monitoring Amazon WorkSpaces](#) in the *Amazon WorkSpaces Administration Guide*.

Amazon WorkSpaces Metrics

The AWS/WorkSpaces namespace includes the following metrics.

Metric	Description	Dimensions	Statistics Available	Units
Available ¹	The number of WorkSpaces that returned a healthy status.	DirectoryId WorkspaceId	Average, Sum, Maximum, Minimum, Data Samples	Count
Unhealthy ¹	The number of WorkSpaces that returned an unhealthy status.	DirectoryId WorkspaceId	Average, Sum, Maximum, Minimum, Data Samples	Count
ConnectionAttempt ²	The number of connection attempts.	DirectoryId WorkspaceId	Average, Sum, Maximum, Minimum, Data Samples	Count
ConnectionSuccess ²	The number of successful connections.	DirectoryId WorkspaceId	Average, Sum, Maximum, Minimum, Data Samples	Count
ConnectionFailure ²	The number of failed connections.	DirectoryId WorkspaceId	Average, Sum, Maximum,	Count

Metric	Description	Dimensions	Statistics Available	Units
			Minimum, Data Samples	
SessionLaunchTime ²	The amount of time it takes to initiate a WorkSpaces session.	DirectoryID WorkspaceID	Average, Sum, Maximum, Minimum, Data Samples	Second (time)
InSessionLatency ²	The round trip time between the WorkSpaces client and the WorkSpace.	DirectoryID WorkspaceID	Average, Sum, Maximum, Minimum, Data Samples	Millisecond (time)
SessionDisconnect ²	The number of connections that were closed, including user-initiated and failed connections.	DirectoryID WorkspaceID	Average, Sum, Maximum, Minimum, Data Samples	Count
UserConnected ³	The number of WorkSpaces that have a user connected.	DirectoryID WorkspaceID	Average, Sum, Maximum, Minimum, Data Samples	Count
Stopped	The number of WorkSpaces that are stopped.	DirectoryID WorkspaceID	Average, Sum, Maximum, Minimum, Data Samples	Count
Maintenance ⁴	The number of WorkSpaces that are under maintenance.	DirectoryID WorkspaceID	Average, Sum, Maximum, Minimum, Data Samples	Count

¹ Amazon WorkSpaces periodically sends status requests to a WorkSpace. A WorkSpace is marked `Available` when it responds to these requests, and `Unhealthy` when it fails to respond to these requests. These metrics are available at a per-WorkSpace granularity, and also aggregated for all WorkSpaces in an organization.

² Amazon WorkSpaces records metrics on connections made to each WorkSpace. These metrics are emitted after a user has successfully authenticated via the WorkSpaces client and the client then initiates a session. The metrics are available at a per-WorkSpace granularity, and also aggregated for all WorkSpaces in a directory.

³ Amazon WorkSpaces periodically sends connection status requests to a WorkSpace. Users are reported as connected when they are actively using their sessions. This metric is available at a per-WorkSpace granularity, and is also aggregated for all WorkSpaces in an organization.

⁴ This metric applies to WorkSpaces that are configured with an `AutoStop` running mode. If you have maintenance enabled for your WorkSpaces, this metric captures the number of WorkSpaces that are

currently under maintenance. This metric is available at a per-WorkSpace granularity, which describes when a WorkSpace went into maintenance and when it was removed.

Dimensions for Amazon WorkSpaces Metrics

Amazon WorkSpaces metrics are available for the following dimensions.

Dimension	Description
DirectoryId	Limits the data you receive to the WorkSpaces in the specified directory. The <code>DirectoryId</code> value is in the form of <code>d-xxxxxxxxxx</code> .
WorkspaceId	Limits the data you receive to the specified WorkSpace. The <code>workspaceId</code> value is in the form <code>ws-xxxxxxxxxx</code> .

Creating Amazon CloudWatch Alarms

You can create a CloudWatch alarm that watches a single metric. The alarm performs one or more actions based on the value of the metric relative to a threshold over a number of time periods. The action can be an Amazon EC2 action, an Auto Scaling action, or a notification sent to an Amazon SNS topic.

Alarms invoke actions for sustained state changes only. CloudWatch alarms do not invoke actions simply because they are in a particular state, the state must have changed and been maintained for a specified number of periods.

After an alarm invokes an action due to a change in state, its subsequent behavior depends on the type of action that you have associated with the alarm. For Amazon EC2 and Auto Scaling actions, the alarm continues to invoke the action for every period that the alarm remains in the new state. For Amazon SNS notifications, no additional actions are invoked.

Note

CloudWatch doesn't test or validate the actions that you specify, nor does it detect any Auto Scaling or Amazon SNS errors resulting from an attempt to invoke nonexistent actions. Make sure that your actions exist.

You can also add alarms to dashboards. When an alarm is on a dashboard, it turns red when it is in the `ALARM` state, making it easier for you to monitor its status proactively.

Alarm States

An alarm has the following possible states:

- `OK`—The metric is within the defined threshold
- `ALARM`—The metric is outside of the defined threshold
- `INSUFFICIENT_DATA`—The alarm has just started, the metric is not available, or not enough data is available for the metric to determine the alarm state

Evaluating an Alarm

In the following figure, the alarm threshold is set to three units and the alarm is configured to trigger when all three datapoints in the most recent three consecutive periods are above the threshold. That is, the alarm state changes to `ALARM` if the oldest of the three periods being evaluated is breaching, and the two subsequent periods are either breaching or missing. In the figure, this happens in the third through fifth time periods. At period six, the value dips below the threshold, and the alarm state changes to `OK`. During the ninth time period, the threshold is breached again, but for only one period. Consequently, the alarm state remains `OK`.

You can configure an alarm to trigger based on an "M out of N" datapoints in any alarm evaluation interval. A datapoint is the value of a metric for a period. If you choose one minute as the aggregation period for a metric, there is one datapoint every minute. You must specify both the number of datapoints that must be breaching ("M") and the number of datapoints to consider ("N") when defining the alarm. The evaluation interval is the number of datapoints multiplied by the period. For example, if you configure 4 out of 5 datapoints with a period of 1 minute, the evaluation interval is 5 minutes. If you configure 3 out of 3 datapoints with a period of 10 minutes, the evaluation interval is 30 minutes. The "M" datapoints do not need to be consecutive during the evaluation interval, so you would be alerted even if the spikes in your metrics are intermittent.

Configuring How CloudWatch Alarms Treats Missing Data

Similar to how each alarm is always in one of three states, each specific data point reported to CloudWatch falls under one of three categories:

- Not breaching (within the threshold)
- Breaching (violating the threshold)
- Missing

You can specify how alarms handle missing data points. Choose whether to treat missing data points as:

- `missing` (The alarm looks back farther in time to find additional data points)
- `notBreaching` (Treated as a data point that is within the threshold)
- `breaching` (Treated as a data point that is breaching the threshold)
- `ignore` (The current alarm state is maintained)

The best choice depends on the type of metric. For a metric that continually reports data, such as `CPUUtilization` of an instance, you might want to treat missing data points as `breaching`, because they may indicate something is wrong. But for a metric that generates data points only when an error occurs, such as `ThrottledRequests` in Amazon DynamoDB, you would want to treat missing data as `notBreaching`. The default behavior is `missing`.

Choosing the best option for your alarm prevents unnecessary and misleading alarm condition changes, and also more accurately indicates the health of your system.

Note

If you treat missing data as `missing` and some data points in the current window are missing, CloudWatch looks back extra periods to find other existing data points to assess whether the alarm should change state. When this happens, if the furthest back period that is now being considered is not breaching, the alarm state does not go to `ALARM`.

High-Resolution Alarms

If you set an alarm on a high-resolution metric, you can specify a high-resolution alarm with a period of 10 seconds or 30 seconds, or you can set a regular alarm with a period of any multiple of 60 seconds. There is a higher charge for high-resolution alarms. For more information about high-resolution metrics, see [Publish Custom Metrics](#) (p. 42).

Percentile-Based CloudWatch Alarms and Low Data Samples

When you set a percentile as the statistic for an alarm, you can specify what to do when there is not enough data for a good statistical assessment. You can choose to have the alarm evaluate the statistic anyway and possibly change the alarm state. Or, you can have the alarm ignore the metric while the sample size is low, and wait to evaluate it until there is enough data to be statistically significant.

For percentiles between 0.5 and 1.00, this setting is used when there are fewer than 10/(1-percentile) data points during the evaluation period. For example, this setting would be used if there were fewer than 1000 samples for an alarm on a p99 percentile. For percentiles between 0 and 0.5, the setting is used when there are fewer than 10/percentile data points.

Common Features of CloudWatch Alarms

The following features apply to all CloudWatch alarms:

- You can create up to 5000 alarms per region per AWS account. To create or update an alarm, you use the `PutMetricAlarm` API action (`mon-put-metric-alarm` command).
- Alarm names must contain only ASCII characters.
- You can list any or all of the currently configured alarms, and list any alarms in a particular state using `DescribeAlarms` (`mon-describe-alarms`). You can further filter the list by time range.
- You can disable and enable alarms by using `DisableAlarmActions` and `EnableAlarmActions` (`mon-disable-alarm-actions` and `mon-enable-alarm-actions`).
- You can test an alarm by setting it to any state using `SetAlarmState` (`mon-set-alarm-state`). This temporary state change lasts only until the next alarm comparison occurs.
- You can create an alarm using `PutMetricAlarm` (`mon-put-metric-alarm`) before you've created a custom metric. For the alarm to be valid, you must include all of the dimensions for the custom metric in addition to the metric namespace and metric name in the alarm definition.
- You can view an alarm's history using `DescribeAlarmHistory` (`mon-describe-alarm-history`). CloudWatch preserves alarm history for two weeks. Each state transition is marked with a unique time stamp. In rare cases, your history might show more than one notification for a state change. The time stamp enables you to confirm unique state changes.
- The number of evaluation periods for an alarm multiplied by the length of each evaluation period cannot exceed one day.

Note

Some AWS resources do not send metric data to CloudWatch under certain conditions. For example, Amazon EBS may not send metric data for an available volume that is not attached to an Amazon EC2 instance, because there is no metric activity to be monitored for that volume. If you have an alarm set for such a metric, you may notice its state change to Insufficient Data. This may indicate that your resource is inactive, and may not necessarily mean that there is a problem.

Set Up Amazon SNS Notifications

Amazon CloudWatch uses Amazon SNS to send email. First, create and subscribe to an SNS topic. When you create a CloudWatch alarm, you can add this SNS topic to send an email notification when the alarm changes state. For more information, see the [Amazon Simple Notification Service Getting Started Guide](#).

Note

Alternatively, if you plan to create your CloudWatch alarm using the AWS Management Console, you can skip this procedure because you can create the topic through the **Create Alarm Wizard**.

Set Up an Amazon SNS Topic Using the AWS Management Console

First, create a topic, then subscribe to it. You can optionally publish a test message to the topic.

To create an SNS topic

1. Open the Amazon SNS console at <https://console.aws.amazon.com/sns/v2/home>.
2. On the Amazon SNS dashboard, under **Common actions**, choose **Create Topic**.
3. In the **Create new topic** dialog box, for **Topic name**, type a name for the topic (for example, my-topic).
4. Choose **Create topic**.
5. Copy the **Topic ARN** for the next task (for example, arn:aws:sns:us-east-1:111122223333:my-topic).

To subscribe to an SNS topic

1. Open the Amazon SNS console at <https://console.aws.amazon.com/sns/v2/home>.
2. In the navigation pane, choose **Subscriptions**, **Create subscription**.
3. In the **Create subscription** dialog box, for **Topic ARN**, paste the topic ARN that you created in the previous task.
4. For **Protocol**, choose **Email**.
5. For **Endpoint**, type an email address that you can use to receive the notification, and then choose **Create subscription**.
6. From your email application and open the message from AWS Notifications and confirm your subscription.

Your web browser displays a confirmation response from Amazon SNS.

To publish a test message to an SNS topic

1. Open the Amazon SNS console at <https://console.aws.amazon.com/sns/v2/home>.
2. In the navigation pane, choose **Topics**.
3. On the **Topics** page, select a topic and choose **Publish to topic**.

4. In the **Publish a message** page, for **Subject**, type a subject line for your message, and for **Message**, type a brief message.
5. Choose **Publish Message**.
6. Check your email to confirm that you received the message.

Set Up an SNS Topic Using the AWS CLI

First you create an SNS topic, and then publish a message directly to the topic to test that you have properly configured it.

To set up an SNS topic

1. Create the topic using the `create-topic` command as follows.

```
aws sns create-topic --name my-topic
```

Amazon SNS returns a topic ARN with the following format:

```
{
  "TopicArn": "arn:aws:sns:us-east-1:111122223333:my-topic"
}
```

2. Subscribe your email address to the topic using the `subscribe` command. If the subscription request succeeds, you receive a confirmation email message.

```
aws sns subscribe --topic-arn arn:aws:sns:us-east-1:111122223333:my-topic --protocol
email --notification-endpoint my-email-address
```

Amazon SNS returns the following:

```
{
  "SubscriptionArn": "pending confirmation"
}
```

3. From your email application and open the message from AWS Notifications and confirm your subscription.

Your web browser displays a confirmation response from Amazon Simple Notification Service.

4. Check the subscription using the `list-subscriptions-by-topic` command.

```
aws sns list-subscriptions-by-topic --topic-arn arn:aws:sns:us-east-1:111122223333:my-
topic
```

Amazon SNS returns the following:

```
{
  "Subscriptions": [
    {
      "Owner": "111122223333",
      "Endpoint": "me@mycompany.com",
      "Protocol": "email",
      "TopicArn": "arn:aws:sns:us-east-1:111122223333:my-topic",
      "SubscriptionArn": "arn:aws:sns:us-east-1:111122223333:my-topic:64886986-
bf10-48fb-a2f1-dab033aa67a3"
    }
  ]
}
```

```
]
}
```

5. (Optional) Publish a test message to the topic using the [publish](#) command.

```
aws sns publish --message "Verification" --topic arn:aws:sns:us-east-1:111122223333:my-  
topic
```

Amazon SNS returns the following:

```
{  
  "MessageId": "42f189a0-3094-5cf6-8fd7-c2dde61a4d7d"  
}
```

6. Check your email to confirm that you received the message.

Create or Edit a CloudWatch Alarm

You can choose specific metrics to trigger the alarm and specify thresholds for those metrics. You can then set your alarm to change state when a metric exceeds a threshold that you have defined.

To create an alarm

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Alarms**, **Create Alarm**.
3. For the **Select Metric** step, do the following:
 - a. Choose a metric category (for example, **EC2 Metrics**).
 - b. Select an instance and metric (for example, **CPUUtilization**).
 - c. For the statistic, choose one of the statistics (for example, **Average**) or predefined percentiles, or specify a custom percentile (for example, **p95.45**).
 - d. Choose a period (for example, **1 Hour**).
 - e. Choose **Next**.
4. For the **Define Alarm** step, do the following:
 - a. Under **Alarm Threshold**, type a unique name for the alarm and a description of the alarm. The alarm name must contain only ASCII characters. For **Whenever**, specify a threshold (for example, 80 percent of CPU utilization) and the number of datapoints ("M" out of "N") that must be breaching to trigger the alarm. For more information, see [Evaluating an Alarm \(p. 268\)](#).
 - b. Under **Additional settings**, for **Treat missing data as**, choose how to have the alarm treat missing data points. For more information, see [Configuring How CloudWatch Alarms Treats Missing Data \(p. 269\)](#).

If the alarm uses a percentile as the monitored statistic, choose whether to evaluate or ignore cases with low sample rates. If you choose **ignore**, the current alarm state is maintained when the sample size is too low. For more information, see [Percentile-Based CloudWatch Alarms and Low Data Samples \(p. 270\)](#).

Additional settings

Provide additional configuration for your alarm.

Treat missing data as : bad (breaching threshold) ⓘ

Percentiles with low samples : ignore (maintain the alarm state) ⓘ

- c. Under **Actions**, select the type of action to have the alarm to perform when the alarm is triggered.
- d. Choose **Create Alarm**.

You can also add alarms to a dashboard. For more information, see [Add or Remove an Alarm from a CloudWatch Dashboard \(p. 23\)](#).

To edit an alarm

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Alarms**.
3. Select the alarm, and then choose **Actions, Modify**.
4. In the **Modify Alarm** dialog box, update the alarm as necessary and choose **Save Changes**.

To update an email notification list that was created using the Amazon SNS console

1. Open the Amazon SNS console at <https://console.aws.amazon.com/sns/v2/home>.
2. In the navigation pane, choose **Topics**, and then select the ARN for your notification list (topic).
3. Do one of the following:
 - To add an email address, choose **Create subscription**. For **Protocol**, choose **Email**. For **Endpoint**, type the email address of the new recipient. Choose **Create subscription**.
 - To remove an email address, choose the **Subscription ID**. Choose **Other subscription actions, Delete subscriptions**.
4. Choose **Publish to topic**.

Create a CPU Usage Alarm that Sends Email

You can create an CloudWatch alarm that sends an email message using Amazon SNS when the alarm changes state from OK to ALARM.

The alarm changes to the ALARM state when the average CPU use of an EC2 instance exceeds a specified threshold for consecutive specified periods.

Set Up a CPU Usage Alarm Using the AWS Management Console

Use these steps to use the AWS Management Console to create a CPU usage alarm.

To create an alarm that sends email based on CPU usage

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Alarms, Create Alarm**.
3. Under **EC2 Metrics**, choose a metric category (for example, **Per-Instance Metrics**).
4. Select a metric as follows:
 - a. Select a row with the instance and the **CPUUtilization** metric.
 - b. For the statistic, choose **Average**, choose one of the predefined percentiles, or specify a custom percentile (for example, p95.45).
 - c. Choose a period (for example, **5 minutes**).

- d. Choose **Next**.

Create Alarm

1. **Select Metric** 2. Define Alarm

EC2 Search Metrics 1 to 50 of 68 Metrics

Auto Auto

Cancel Previous Next Create Alarm

5. Define the alarm as follows:

- Under **Alarm Threshold**, type a unique name for the alarm (for example, myHighCpuAlarm) and a description of the alarm (for example, CPU usage exceeds 70 percent). Alarm names must contain only ASCII characters.
- Under **Whenever**, for **is**, choose **>** and type **70**. For **for**, type **2**. This specifies that the alarm is triggered if the CPU usage is above 70 percent for two consecutive sampling periods.

Alarm Threshold

Provide the details and threshold for your alarm. Use the graph on the right to help set the appropriate threshold.

Name: myHighCpuAlarm

Description: CPU usage exceeds 70 percent

Whenever: CPUUtilization

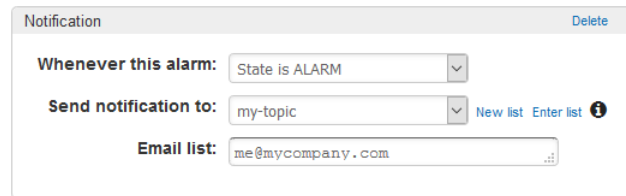

is: > 70

for: 2 consecutive period(s)

- Under **Additional settings**, for **Treat missing data as**, choose **bad (breaching threshold)**, as missing data points may indicate the instance is down.
- Under **Actions**, for **Whenever this alarm**, choose **State is ALARM**. For **Send notification to**, select an existing SNS topic or create a new one.

Actions

Define what actions are taken when your alarm changes state.

- e. To create a new SNS topic, choose **New list**. For **Send notification to**, type a name for the SNS topic (for example, myHighCpuAlarm), and for **Email list**, type a comma-separated list of email addresses to be notified when the alarm changes to the **ALARM** state. Each email address is sent a topic subscription confirmation email. You must confirm the subscription before notifications can be sent.
- f. Choose **Create Alarm**.

Set Up a CPU Usage Alarm Using the AWS CLI

Use these steps to use the AWS CLI to create a CPU usage alarm.

To create an alarm that sends email based on CPU usage

1. Set up an SNS topic. For more information, see [Set Up Amazon SNS Notifications \(p. 271\)](#).
2. Create an alarm using the `put-metric-alarm` command as follows.

```
aws cloudwatch put-metric-alarm --alarm-name cpu-mon --alarm-description "Alarm when CPU exceeds 70%" --metric-name CPUUtilization --namespace AWS/EC2 --statistic Average --period 300 --threshold 70 --comparison-operator GreaterThanThreshold --dimensions Name=InstanceId,Value=i-12345678 --evaluation-periods 2 --alarm-actions arn:aws:sns:us-east-1:111122223333:my-topic --unit Percent
```

3. Test the alarm by forcing an alarm state change using the `set-alarm-state` command.
 - a. Change the alarm state from `INSUFFICIENT_DATA` to `OK`:

```
aws cloudwatch set-alarm-state --alarm-name cpu-mon --state-reason "initializing" --state-value OK
```

- b. Change the alarm state from `OK` to `ALARM`:

```
aws cloudwatch set-alarm-state --alarm-name cpu-mon --state-reason "initializing" --state-value ALARM
```

- c. Check that you have received an email notification about the alarm.

Create a Load Balancer Latency Alarm that Sends Email

You can set up an Amazon SNS notification and configure an alarm that monitors latency exceeding 100 ms for your Classic Load Balancer.

Set Up a Latency Alarm Using the AWS Management Console

Use these steps to use the AWS Management Console to create a load balancer latency alarm.

To create a load balancer latency alarm that sends email

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Alarms, Create Alarm**.
3. Under **CloudWatch Metrics by Category**, choose the **ELB Metrics** category.
4. Select the row with the Classic Load Balancer and the **Latency** metric.
5. For the statistic, choose **Average**, choose one of the predefined percentiles, or specify a custom percentile (for example, p95.45).
6. For the period, choose **1 Minute**.
7. Choose **Next**.
8. Under **Alarm Threshold**, type a unique name for the alarm (for example, **myHighCpuAlarm**) and a description of the alarm (for example, Alarm when Latency exceeds 100s). Alarm names must contain only ASCII characters.
9. Under **Whenever**, for **is**, choose **>** and type **0.1**. For **for**, type **3**.
10. Under **Additional settings**, for **Treat missing data as**, choose **ignore (maintain alarm state)** so that missing data points do not trigger alarm state changes.

For **Percentiles with low samples** choose **ignore (maintain the alarm state)** so that the alarm evaluates only situations with adequate numbers of data samples.

11. Under **Actions**, for **Whenever this alarm**, choose **State is ALARM**. For **Send notification to** choose an existing SNS topic or create a new one.

To create an SNS topic, choose **New list**. For **Send notification to**, type a name for the SNS topic (for example, **myHighCpuAlarm**), and for **Email list**, type a comma-separated list of email addresses to be notified when the alarm changes to the **ALARM** state. Each email address is sent a topic subscription confirmation email. You must confirm the subscription before notifications can be sent.

12. Choose **Create Alarm**.

Set Up a Latency Alarm Using the AWS CLI

Use these steps to use the AWS CLI to create a load balancer latency alarm.

To create a load balancer latency alarm that sends email

1. Set up an SNS topic. For more information, see [Set Up Amazon SNS Notifications \(p. 271\)](#).
2. Create the alarm using the `put-metric-alarm` command as follows:

```
aws cloudwatch put-metric-alarm --alarm-name lb-mon --alarm-description "Alarm
when Latency exceeds 100s" --metric-name Latency --namespace AWS/ELB --statistic
Average --period 60 --threshold 100 --comparison-operator GreaterThanThreshold --
dimensions Name=LoadBalancerName,Value=my-server --evaluation-periods 3 --alarm-actions
arn:aws:sns:us-east-1:111122223333:my-topic --unit Seconds
```

3. Test the alarm by forcing an alarm state change using the `set-alarm-state` command.
 - a. Change the alarm state from `INSUFFICIENT_DATA` to `OK`:

```
aws cloudwatch set-alarm-state --alarm-name lb-mon --state-reason "initializing" --state-value OK
```

- b. Change the alarm state from OK to ALARM:

```
aws cloudwatch set-alarm-state --alarm-name lb-mon --state-reason "initializing" --state-value ALARM
```

- c. Check that you have received an email notification about the alarm.

Create a Storage Throughput Alarm that Sends Email

You can set up an SNS notification and configure an alarm that sends email when Amazon EBS exceeds 100 MB throughput.

Set Up a Storage Throughput Alarm Using the AWS Management Console

Use these steps to use the AWS Management Console to create an alarm based on Amazon EBS throughput.

To create a storage throughput alarm that sends email

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Alarms**, **Create Alarm**.
3. Under **EBS Metrics**, choose a metric category.
4. Select the row with the volume and the **VolumeWriteBytes** metric.
5. For the statistic, choose **Average**. For the period, choose **5 Minutes**. Choose **Next**.
6. Under **Alarm Threshold**, type a unique name for the alarm (for example, myHighWriteAlarm) and a description of the alarm (for example, VolumeWriteBytes exceeds 100,000 KiB/s). Alarm names must contain only ASCII characters.
7. Under **Whenever**, for **is**, choose **>** and type **100000**. For **for**, type **15** consecutive periods.

A graphical representation of the threshold is shown under **Alarm Preview**.

8. Under **Additional settings**, for **Treat missing data as**, choose **ignore (maintain alarm state)** so that missing data points do not trigger alarm state changes.
9. Under **Actions**, for **Whenever this alarm**, choose **State is ALARM**. For **Send notification to**, choose an existing SNS topic or create one.

To create an SNS topic, choose **New list**. For **Send notification to**, type a name for the SNS topic (for example, myHighCpuAlarm), and for **Email list**, type a comma-separated list of email addresses to be notified when the alarm changes to the **ALARM** state. Each email address is sent a topic subscription confirmation email. You must confirm the subscription before notifications can be sent to an email address.

10. Choose **Create Alarm**.

Set Up a Storage Throughput Alarm Using the AWS CLI

Use these steps to use the AWS CLI to create an alarm based on Amazon EBS throughput.

To create a storage throughput alarm that sends email

1. Create an SNS topic. For more information, see [Set Up Amazon SNS Notifications \(p. 271\)](#).
2. Create the alarm.

```
aws cloudwatch put-metric-alarm --alarm-name ebs-mon --alarm-description "Alarm when EBS volume exceeds 100MB throughput" --metric-name VolumeReadBytes --namespace AWS/EBS --statistic Average --period 300 --threshold 100000000 --comparison-operator GreaterThanThreshold --dimensions Name=VolumeId,Value=my-volume-id --evaluation-periods 3 --alarm-actions arn:aws:sns:us-east-1:111122223333:my-alarm-topic --insufficient-data-actions arn:aws:sns:us-east-1:111122223333:my-insufficient-data-topic
```

3. Test the alarm by forcing an alarm state change using the [set-alarm-state](#) command.
 - a. Change the alarm state from `INSUFFICIENT_DATA` to `OK`:

```
aws cloudwatch set-alarm-state --alarm-name ebs-mon --state-reason "initializing" --state-value OK
```

- b. Change the alarm state from `OK` to `ALARM`:

```
aws cloudwatch set-alarm-state --alarm-name ebs-mon --state-reason "initializing" --state-value ALARM
```

- c. Change the alarm state from `ALARM` to `INSUFFICIENT_DATA`:

```
aws cloudwatch set-alarm-state --alarm-name ebs-mon --state-reason "initializing" --state-value INSUFFICIENT_DATA
```

- d. Check that you have received an email notification about the alarm.

Create Alarms to Stop, Terminate, Reboot, or Recover an Instance

Using Amazon CloudWatch alarm actions, you can create alarms that automatically stop, terminate, reboot, or recover your EC2 instances. You can use the stop or terminate actions to help you save money when you no longer need an instance to be running. You can use the reboot and recover actions to automatically reboot those instances or recover them onto new hardware if a system impairment occurs.

There are a number of scenarios in which you might want to automatically stop or terminate your instance. For example, you might have instances dedicated to batch payroll processing jobs or scientific computing tasks that run for a period of time and then complete their work. Rather than letting those instances sit idle (and accrue charges), you can stop or terminate them which can help you to save money. The main difference between using the stop and the terminate alarm actions is that you can easily restart a stopped instance if you need to run it again later, and you can keep the same instance ID and root volume. However, you cannot restart a terminated instance. Instead, you must launch a new instance.

You can add the stop, terminate, reboot, or recover actions to any alarm that is set on an Amazon EC2 per-instance metric, including basic and detailed monitoring metrics provided by Amazon CloudWatch (in the AWS/EC2 namespace), in addition to any custom metrics that include the "InstanceId=" dimension, as long as the InstanceId value refers to a valid running Amazon EC2 instance.

To set up a CloudWatch alarm action that can reboot, stop, or terminate an instance, you must use a service-linked IAM role, *AWSServiceRoleForCloudWatchEvents*. The *AWSServiceRoleForCloudWatchEvents* IAM role enables AWS to perform alarm actions on your behalf.

To create the service-linked role for CloudWatch Events, use the following command:

```
aws iam create-service-linked-role --aws-service-name events.amazonaws.com
```

Note

The *AWSServiceRoleForCloudWatchEvents* role is not needed for the recover action.

Console Support

You can create alarms using the CloudWatch console or the Amazon EC2 console. The procedures in this documentation use the CloudWatch console. For procedures that use the Amazon EC2 console, see [Create Alarms That Stop, Terminate, Reboot, or Recover an Instance](#) in the *Amazon EC2 User Guide for Linux Instances*.

Permissions

If you are using an AWS Identity and Access Management (IAM) account to create or modify an alarm, you must have the following permissions:

- `iam:CreateServiceLinkedRole` for all alarms with Amazon EC2 actions
- `ec2:DescribeInstanceStatus` and `ec2:DescribeInstances` — For all alarms on Amazon EC2 instance status metrics
- `ec2:StopInstances` — For alarms with stop actions
- `ec2:TerminateInstances` — For alarms with terminate actions
- `ec2:DescribeInstanceRecoveryAttribute` and `ec2:RecoverInstances` — For alarms with recover actions

If you have read/write permissions for Amazon CloudWatch but not for Amazon EC2, you can still create an alarm but the stop or terminate actions won't be performed on the instance. However, if you are later granted permission to use the associated Amazon EC2 API actions, the alarm actions you created earlier will be performed. For more information, see [Permissions and Policies](#) in the *IAM User Guide*.

If you want to use an IAM role to stop, terminate, or reboot an instance using an alarm action, you can only use the *AWSServiceRoleForCloudWatchEvents* role. Other IAM roles are not supported. However, you can still see the alarm state and perform any other actions such as Amazon SNS notifications or Amazon EC2 Auto Scaling policies.

Contents

- [Adding Terminate Actions to Amazon CloudWatch Alarms \(p. 281\)](#)
- [Adding Reboot Actions to Amazon CloudWatch Alarms \(p. 282\)](#)
- [Adding Recover Actions to Amazon CloudWatch Alarms \(p. 283\)](#)
- [Viewing the History of Triggered Alarms and Actions \(p. 284\)](#)

Adding Stop Actions to Amazon CloudWatch Alarms

You can create an alarm that stops an Amazon EC2 instance when a certain threshold has been met. For example, you may run development or test instances and occasionally forget to shut them off. You can create an alarm that is triggered when the average CPU utilization percentage has been lower than 10 percent for 24 hours, signaling that it is idle and no longer in use. You can adjust the threshold, duration, and period to suit your needs, plus you can add an SNS notification, so that you will receive an email when the alarm is triggered.

Amazon EC2 instances that use an Amazon Elastic Block Store volume as the root device can be stopped or terminated, whereas instances that use the instance store as the root device can only be terminated.

To create an alarm to stop an idle instance using the Amazon CloudWatch console

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Alarms, Create Alarm**.
3. For the **Select Metric** step, do the following:
 - a. Under **EC2 Metrics**, choose **Per-Instance Metrics**.
 - b. Select the row with the instance and the **CPUUtilization** metric.
 - c. For the statistic, choose **Average**.
 - d. Choose a period (for example, **1 Hour**).
 - e. Choose **Next**.
4. For the **Define Alarm** step, do the following:
 - a. Under **Alarm Threshold**, type a unique name for the alarm (for example, Stop EC2 instance) and a description of the alarm (for example, Stop EC2 instance when CPU is idle too long). Alarm names must contain only ASCII characters.
 - b. Under **Whenever**, for **is**, choose **<** and type **10**. For **for**, type **24** consecutive periods.

A graphical representation of the threshold is shown under **Alarm Preview**.
 - c. Under **Notification**, for **Send notification to**, choose an existing SNS topic or create a new one.

To create an SNS topic, choose **New list**. For **Send notification to**, type a name for the SNS topic (for example, Stop_EC2_Instance). For **Email list**, type a comma-separated list of email addresses to be notified when the alarm changes to the **ALARM** state. Each email address is sent a topic subscription confirmation email. You must confirm the subscription before notifications can be sent to an email address.
 - d. Choose **EC2 Action**.
 - e. For **Whenever this alarm**, choose **State is ALARM**. For **Take this action**, choose **Stop this instance**.
 - f. Choose **Create Alarm**.

Adding Terminate Actions to Amazon CloudWatch Alarms

You can create an alarm that terminates an EC2 instance automatically when a certain threshold has been met (as long as termination protection is not enabled for the instance). For example, you might want to terminate an instance when it has completed its work, and you don't need the instance again. If you might want to use the instance later, you should stop the instance instead of terminating it. For information about enabling and disabling termination protection for an instance, see [Enabling Termination Protection for an Instance](#) in the *Amazon EC2 User Guide for Linux Instances*.

To create an alarm to terminate an idle instance using the Amazon CloudWatch console

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Alarms**, **Create Alarm**.
3. For the **Select Metric** step, do the following:
 - a. Under **EC2 Metrics**, choose **Per-Instance Metrics**.
 - b. Select the row with the instance and the **CPUUtilization** metric.
 - c. For the statistic, choose **Average**.
 - d. Choose a period (for example, **1 Hour**).
 - e. Choose **Next**.
4. For the **Define Alarm** step, do the following:
 - a. Under **Alarm Threshold**, type a unique name for the alarm (for example, Terminate EC2 instance) and a description of the alarm (for example, Terminate EC2 instance when CPU is idle for too long). Alarm names must contain only ASCII characters.
 - b. Under **Whenever**, for **is**, choose **<** and type **10**. For **for**, type **24** consecutive periods.

A graphical representation of the threshold is shown under **Alarm Preview**.
 - c. Under **Notification**, for **Send notification to**, choose an existing SNS topic or create a new one.

To create an SNS topic, choose **New list**. For **Send notification to**, type a name for the SNS topic (for example, Terminate_EC2_Instance). For **Email list**, type a comma-separated list of email addresses to be notified when the alarm changes to the **ALARM** state. Each email address is sent a topic subscription confirmation email. You must confirm the subscription before notifications can be sent to an email address.
 - d. Choose **EC2 Action**.
 - e. For **Whenever this alarm**, choose **State is ALARM**. For **Take this action**, choose **Terminate this instance**.
 - f. Choose **Create Alarm**.

Adding Reboot Actions to Amazon CloudWatch Alarms

You can create an Amazon CloudWatch alarm that monitors an Amazon EC2 instance and automatically reboots the instance. The reboot alarm action is recommended for Instance Health Check failures (as opposed to the recover alarm action, which is suited for System Health Check failures). An instance reboot is equivalent to an operating system reboot. In most cases, it takes only a few minutes to reboot your instance. When you reboot an instance, it remains on the same physical host, so your instance keeps its public DNS name, private IP address, and any data on its instance store volumes.

Rebooting an instance doesn't start a new instance billing hour, unlike stopping and restarting your instance. For more information about rebooting an instance, see [Reboot Your Instance](#) in the *Amazon EC2 User Guide for Linux Instances*.

Important

To avoid a race condition between the reboot and recover actions, avoid setting the same evaluation period for both a reboot alarm and a recover alarm. We recommend that you set reboot alarms to three evaluation periods of one minute each.

To create an alarm to reboot an instance using the Amazon CloudWatch console

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.

2. In the navigation pane, choose **Alarms, Create Alarm**.
3. For the **Select Metric** step, do the following:
 - a. Under **EC2 Metrics**, choose **Per-Instance Metrics**.
 - b. Select the row with the instance and the **StatusCheckFailed_Instance** metric.
 - c. For the statistic, choose **Minimum**.
 - d. Choose a period (for example, **1 Minute**) and choose **Next**.
4. For the **Define Alarm** step, do the following:
 - a. Under **Alarm Threshold**, type a unique name for the alarm (for example, Reboot EC2 instance) and a description of the alarm (for example, Reboot EC2 instance when health checks fail). Alarm names must contain only ASCII characters.
 - b. Under **Whenever**, for **is**, choose **>** and type **0**. For **for**, type **3** consecutive periods.

A graphical representation of the threshold is shown under **Alarm Preview**.
 - c. Under **Notification**, for **Send notification to**, choose an existing SNS topic or create a new one.

To create an SNS topic, choose **New list**. For **Send notification to**, type a name for the SNS topic (for example, Reboot_EC2_Instance). For **Email list**, type a comma-separated list of email addresses to be notified when the alarm changes to the **ALARM** state. Each email address is sent a topic subscription confirmation email. You must confirm the subscription before notifications can be sent to an email address.
 - d. Choose **EC2 Action**.
 - e. For **Whenever this alarm**, choose **State is ALARM**. For **Take this action**, choose **Reboot this instance**.
 - f. Choose **Create Alarm**.

Adding Recover Actions to Amazon CloudWatch Alarms

You can create an Amazon CloudWatch alarm that monitors an Amazon EC2 instance and automatically recovers the instance if it becomes impaired due to an underlying hardware failure or a problem that requires AWS involvement to repair. Terminated instances cannot be recovered. A recovered instance is identical to the original instance, including the instance ID, private IP addresses, Elastic IP addresses, and all instance metadata.

When the `StatusCheckFailed_System` alarm is triggered, and the recover action is initiated, you will be notified by the Amazon SNS topic that you chose when you created the alarm and associated the recover action. During instance recovery, the instance is migrated during an instance reboot, and any data that is in-memory is lost. When the process is complete, information is published to the SNS topic you've configured for the alarm. Anyone who is subscribed to this SNS topic will receive an email notification that includes the status of the recovery attempt and any further instructions. You will notice an instance reboot on the recovered instance.

The recover action can be used only with `StatusCheckFailed_System`, not with `StatusCheckFailed_Instance`.

Examples of problems that cause system status checks to fail include:

- Loss of network connectivity
- Loss of system power
- Software issues on the physical host
- Hardware issues on the physical host

The recover action is only supported on:

- The C3, C4, C5, M3, M4, R3, R4, T2, and X1 instance types
- Instances in a VPC
- Instances with shared tenancy (the `tenancy` attribute is set to `default`)
- Instances that use Amazon EBS storage exclusively

If your instance has a public IP address, it will retain the same public IP address after recovery.

Important

To avoid a race condition between the reboot and recover actions, avoid setting the same evaluation period for both a reboot alarm and a recover alarm. We recommend that you set recover alarms to two evaluation periods of one minute each and reboot alarms to three evaluation periods of one minute each.

To create an alarm to recover an instance using the Amazon CloudWatch console

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Alarms, Create Alarm**.
3. For the **Select Metric** step, do the following:
 - a. Under **EC2 Metrics**, choose **Per-Instance Metrics**.
 - b. Select the row with the instance and the **StatusCheckFailed_System** metric.
 - c. For the statistic, choose **Minimum**.
 - d. Choose a period (for example, **1 Minute**).

Important

To avoid a race condition between the reboot and recover actions, avoid setting the same evaluation period for both a reboot alarm and a recover alarm. We recommend that you set recover alarms to two evaluation periods of one minute each.

 - e. Choose **Next**.
4. For the **Define Alarm** step, do the following:
 - a. Under **Alarm Threshold**, type a unique name for the alarm (for example, Recover EC2 instance) and a description of the alarm (for example, Recover EC2 instance when health checks fail). Alarm names must contain only ASCII characters.
 - b. Under **Whenever**, for **is**, choose **>** and type **0**. For **for**, type **2** consecutive periods.
 - c. Under **Notification**, for **Send notification to**, choose an existing SNS topic or create a new one.

To create an SNS topic, choose **New list**. For **Send notification to**, type a name for the SNS topic (for example, Recover_EC2_Instance). For **Email list**, type a comma-separated list of email addresses to be notified when the alarm changes to the `ALARM` state. Each email address is sent a topic subscription confirmation email. You must confirm the subscription before notifications can be sent to an email address.
 - d. Choose **EC2 Action**.
 - e. For **Whenever this alarm**, choose **State is ALARM**. For **Take this action**, choose **Recover this instance**.
 - f. Choose **Create Alarm**.

Viewing the History of Triggered Alarms and Actions

You can view alarm and action history in the Amazon CloudWatch console. Amazon CloudWatch keeps the last two weeks' worth of alarm and action history.

To view the history of triggered alarms and actions

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Alarms**.
3. Choose the alarm.
4. To view the most recent state transition along with the time and metric values, choose **Details**.
5. To view the most recent history entries, choose the **History**.

Create a Billing Alarm to Monitor Your Estimated AWS Charges

You can monitor your estimated AWS charges using Amazon CloudWatch. When you enable the monitoring of estimated charges for your AWS account, the estimated charges are calculated and sent several times daily to CloudWatch as metric data.

Billing metric data is stored in the US East (N. Virginia) region and represents worldwide charges. This data includes the estimated charges for every service in AWS that you use, in addition to the estimated overall total of your AWS charges.

You can choose to receive alerts by email when charges have exceeded a certain threshold. These alerts are triggered by CloudWatch and messages are sent using Amazon SNS.

Tasks

- [Enable Billing Alerts \(p. 285\)](#)
- [Create a Billing Alarm \(p. 286\)](#)
- [Check the Alarm Status \(p. 287\)](#)
- [Delete a Billing Alarm \(p. 287\)](#)

Enable Billing Alerts

Before you can create an alarm for your estimated charges, you must enable billing alerts, so that you can monitor your estimated AWS charges and create an alarm using billing metric data. After you enable billing alerts, you cannot disable data collection, but you can delete any billing alarms you created.

After you enable billing alerts for the first time, it takes about 15 minutes before you can view billing data and set billing alarms.

Requirements

- You must be signed in using AWS account root user credentials; IAM users cannot enable billing alerts for your AWS account.
- For consolidated billing accounts, billing data for each linked account can be found by logging in as the paying account. You can view billing data for total estimated charges and estimated charges by service for each linked account in addition to the consolidated account.

To enable the monitoring of estimated charges

1. Open the Billing and Cost Management console at <https://console.aws.amazon.com/billing/home?#>.
2. In the navigation pane, choose **Preferences**.
3. Choose **Receive Billing Alerts**.

Dashboard
Bills
Cost Explorer
Budgets
Reports
Cost Allocation Tags
Payment Methods
Payment History
Consolidated Billing
Preferences
Credits
Tax Settings
DevPay

Preferences

☐ **Receive PDF Invoice By Email**
Turn on this feature to receive a PDF version of your invoice by email. Invoices are generally available within the first three days of the month.

☒ **Receive Billing Alerts**
Turn on this feature to monitor your AWS usage charges and recurring fees automatically, making it easier to track and manage your spending on AWS. You can set up billing alerts to receive email notifications when your charges reach a specified threshold. Once enabled, this preference cannot be disabled. [Manage Billing Alerts](#)

☐ **Receive Billing Reports**
Turn on this feature to receive ongoing reports of your AWS charges once or more daily. AWS delivers these reports to the Amazon S3 bucket that you specify where indicated below. For consolidated billing customers, AWS generates reports only for paying accounts. Linked accounts cannot sign up for billing reports.

Save to S3 Bucket:

4. Choose **Save preferences**.

Create a Billing Alarm

After you've enabled billing alerts, you can create a billing alarm. In this procedure, you create an alarm that sends an email message when your estimated charges for AWS exceed a specified threshold.

Note

This procedure uses the advanced options. To use the simple options, see [Create a Billing Alarm \(p. 13\)](#) in *Monitor Your Estimated Charges Using CloudWatch*.

To create a billing alarm using the CloudWatch console

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. If necessary, change the region to US East (N. Virginia). Billing metric data is stored in this region and represents worldwide charges.
3. In the navigation pane, choose **Alarms, Billing, Create Alarm**.
4. Choose **show advanced** to switch to the advanced options.
5. Under **Alarm Threshold**, replace the default name for the alarm (for example, My Estimated Charges) and a description for the alarm (for example, Estimated Monthly Charges). Alarm names must contain only ASCII characters.
6. Under **Whenever charges for**, for **is**, choose **>=** and then type the monetary amount (for example, 200) that must be exceeded to trigger the alarm and send an email.

Note

Under **Alarm Preview**, there is an estimate of your charges that you can use to set an appropriate amount.

7. Under **Additional settings**, for **Treat missing data as**, choose **ignore (maintain alarm state)** so that missing data points do not trigger alarm state changes.
8. Under **Actions**, for **Whenever this alarm**, choose **State is ALARM**. For **Send notification to**, choose an existing SNS topic or create a new one.

To create an SNS topic, choose **New list**. For **Send notification to**, type a name for the SNS topic, and for **Email list**, type a comma-separated list of email addresses where email notifications should be sent. Each email address is sent a topic subscription confirmation email. You must confirm the subscription before notifications can be sent to an email address.

9. Choose **Create Alarm**.

Check the Alarm Status

You can check the status of your billing alarm.

To check alarm status

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. If necessary, change the region to US East (N. Virginia). Billing metric data is stored in this region and reflects worldwide charges.
3. In the navigation pane, choose **Alarms, Billing**.
4. Select the check box next to the alarm. Note that until the subscription is confirmed, it is shown as "Pending confirmation". After the subscription is confirmed, refresh the console to show the updated status.

Delete a Billing Alarm

You can delete your billing alarm when you no longer need it.

To delete a billing alarm

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. If necessary, change the region to US East (N. Virginia). Billing metric data is stored in this region and reflects worldwide charges.
3. In the navigation pane, choose **Alarms, Billing**.
4. Select the check box next to the alarm and then choose **Delete**.
5. When prompted for confirmation, choose **Yes, Delete**.

Hide Auto Scaling Alarms

When you view your alarms in the AWS Management Console, you can hide the alarms related to Auto Scaling. This feature is available only in the AWS Management Console.

To temporarily hide Auto Scaling alarms

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Alarms**.
3. Select **Hide all AutoScaling alarms**.

Authentication and Access Control for Amazon CloudWatch

Access to Amazon CloudWatch requires credentials. Those credentials must have permissions to access AWS resources, such as retrieving CloudWatch metric data about your cloud resources. The following sections provide details about how you can use [AWS Identity and Access Management \(IAM\)](#) and CloudWatch to help secure your resources by controlling who can access them:

- [Authentication](#) (p. 288)
- [Access Control](#) (p. 289)

Authentication

You can access AWS as any of the following types of identities:

- **AWS account root user** – When you sign up for AWS, you provide an email address and password that is associated with your AWS account. These are your *AWS account user credentials* and they provide complete access to all of your AWS resources.

Important

For security reasons, we recommend that you use the AWS account user credentials only to create an *administrator*, which is an *IAM user* with full permissions to your AWS account. Then, you can use this administrator to create other IAM users and roles with limited permissions. For more information, see [IAM Best Practices](#) and [Creating an Admin User and Group](#) in the *IAM User Guide*.

- **IAM user** – An [IAM user](#) is an identity within your AWS account that has specific custom permissions (for example, permissions to view metrics in CloudWatch). You can use an IAM user name and password to sign in to secure AWS webpages like the [AWS Management Console](#), [AWS Discussion Forums](#), or the [AWS Support Center](#).

In addition to a user name and password, you can also generate [access keys](#) for each user. You can use these keys when you access AWS services programmatically, either through [one of the several SDKs](#) or by using the [AWS Command Line Interface \(CLI\)](#). The SDK and AWS CLI tools use the access keys to cryptographically sign your request. If you don't use the AWS tools, you must sign the request yourself. CloudWatch supports *Signature Version 4*, a protocol for authenticating inbound API requests. For more information about authenticating requests, see [Signature Version 4 Signing Process](#) in the *AWS General Reference*.

- **IAM role** – An [IAM role](#) is another IAM identity you can create in your account that has specific permissions. It is similar to an *IAM user*, but it is not associated with a specific person. An IAM role enables you to obtain temporary access keys that can be used to access AWS services and resources. IAM roles with temporary credentials are useful in the following situations:

- **Federated user access** – Instead of creating an IAM user, you can use preexisting identities from AWS Directory Service, your enterprise user directory, or a web identity provider (IdP). These are known as *federated users*. AWS assigns a role to a federated user when access is requested through an IdP. For more information, see [Federated Users and Roles](#) in the *IAM User Guide*.
- **Cross-account access** – You can use an IAM role in your account to grant another AWS account permissions to access your account's resources. For an example, see [Tutorial: Delegate Access Across AWS Accounts Using IAM Roles](#) in the *IAM User Guide*.
- **AWS service access** – You can use an IAM role in your account to grant an AWS service the permissions needed to access your account's resources. For example, you can create a role that allows Amazon Redshift to access an Amazon S3 bucket on your behalf and then load data stored in the bucket into an Amazon Redshift cluster. For more information, see [Creating a Role to Delegate Permissions to an AWS Service](#) in the *IAM User Guide*.
- **Applications running on Amazon EC2** – Instead of storing access keys within the EC2 instance for use by applications running on the instance and making API requests, you can use an IAM role to manage temporary credentials for these applications. To assign an AWS role to an EC2 instance and make it available to all of its applications, you can create an instance profile that is attached to the instance. An instance profile contains the role and enables programs running on the EC2 instance to get temporary credentials. For more information, see [Using Roles for Applications on Amazon EC2](#) in the *IAM User Guide*.

Access Control

You can have valid credentials to authenticate your requests, but unless you have permissions you cannot create or access CloudWatch resources. For example, you must have permissions to create CloudWatch dashboard widgets, view metrics, and so on.

The following sections describe how to manage permissions for CloudWatch. We recommend that you read the overview first.

- [Overview of Managing Access Permissions to Your CloudWatch Resources](#) (p. 290)
- [Using Identity-Based Policies \(IAM Policies\) for CloudWatch](#) (p. 294)
- [Amazon CloudWatch Permissions Reference](#) (p. 303)

CloudWatch Dashboard Permissions Update

On April 1, 2018, the permissions required to access CloudWatch dashboards will change. Currently, the **cloudwatch:GetMetricData** permission is required to view CloudWatch dashboards, and the **cloudwatch:PutMetricData** permission is required to create or modify dashboards. Beginning on April 1, dashboard access in the CloudWatch console will instead require newer permissions that were introduced in 2017 to support dashboard API operations:

- **cloudwatch:GetDashboard**
- **cloudwatch:ListDashboards**
- **cloudwatch:PutDashboard**
- **cloudwatch>DeleteDashboards**

To check whether you will have access to CloudWatch dashboards after the change, choose **Check permissions** in update messages in the CloudWatch console. If that check shows that you will not have these permissions after the update, you should use the IAM console to fix your permissions before April 1.

To retain access to CloudWatch dashboards, you need one of the following:

- The **AdministratorAccess** policy.
- The **CloudWatchFullAccess** policy.
- A custom policy that includes one or more of these specific permissions:
 - `cloudwatch:GetDashboard` and `cloudwatch:ListDashboards` to be able to view dashboards
 - `cloudwatch:PutDashboard` to be able to create or modify dashboards
 - `cloudwatch:DeleteDashboards` to be able to delete dashboards

For more information for changing permissions for an IAM user using policies, see [Changing Permissions for an IAM User](#).

For more information about CloudWatch permissions, see [Amazon CloudWatch Permissions Reference \(p. 303\)](#).

For more information about dashboard API operations, see [PutDashboard](#) in the Amazon CloudWatch API Reference.

Overview of Managing Access Permissions to Your CloudWatch Resources

Every AWS resource is owned by an AWS account, and permissions to create or access a resource are governed by permissions policies. An account administrator can attach permissions policies to IAM identities (that is, users, groups, and roles), and some services (such as AWS Lambda) also support attaching permissions policies to resources.

Note

An *account administrator* (or administrator user) is a user with administrator privileges. For more information, see [IAM Best Practices](#) in the *IAM User Guide*.

When granting permissions, you decide who is getting the permissions, the resources they get permissions for, and the specific actions that you want to allow on those resources.

Topics

- [CloudWatch Resources and Operations \(p. 290\)](#)
- [Understanding Resource Ownership \(p. 292\)](#)
- [Managing Access to Resources \(p. 292\)](#)
- [Specifying Policy Elements: Actions, Effects, and Principals \(p. 293\)](#)
- [Specifying Conditions in a Policy \(p. 294\)](#)

CloudWatch Resources and Operations

CloudWatch doesn't have any specific resources for you to control access to. Therefore, there are no CloudWatch Amazon Resource Names (ARNs) for you to use in an IAM policy. For example, you can't

give a user access to CloudWatch data for only a specific set of EC2 instances or a specific load balancer. Permissions granted using IAM cover all the cloud resources you use or monitor with CloudWatch. In addition, you can't use IAM roles with the CloudWatch command line tools.

You use an * (asterisk) as the resource when writing a policy to control access to CloudWatch actions. For example:

```
{
  "Version": "2012-10-17",
  "Statement": [{
    "Effect": "Allow",
    "Action": ["cloudwatch:GetMetricStatistics", "cloudwatch:ListMetrics"],
    "Resource": "*",
    "Condition": {
      "Bool": {
        "aws:SecureTransport": "true"
      }
    }
  }]
}
```

For more information about ARNs, see [ARNs](#) in *IAM User Guide*. For information about CloudWatch Logs ARNs, see [Amazon Resource Names \(ARNs\) and AWS Service Namespaces](#) in the *Amazon Web Services General Reference*. For an example of a policy that covers CloudWatch actions, see [Using Identity-Based Policies \(IAM Policies\) for CloudWatch](#) (p. 294).

Action	ARN (with region)	ARN (for use with IAM role)
Stop	arn:aws:automate:us-east-1:ec2:stop	arn:aws:swf:us-east-1: <i>customer-account</i> :action/actions/AWS_EC2.InstanceId.Stop/1.0 Note You must create at least one stop alarm using the Amazon EC2 or CloudWatch console to create the EC2ActionsAccess IAM role. After this IAM role is created, you can create stop alarms using the AWS CLI.
Terminate	arn:aws:automate:us-east-1:ec2:terminate	arn:aws:swf:us-east-1: <i>customer-account</i> :action/actions/AWS_EC2.InstanceId.Terminate/1.0 Note You must create at least one terminate alarm using the Amazon EC2 or CloudWatch console to create the EC2ActionsAccess IAM role. After this IAM

Action	ARN (with region)	ARN (for use with IAM role)
		role is created, you can create terminate alarms using the AWS CLI.
Reboot	n/a	<code>arn:aws:swf:us-east-1:<i>customer-account</i>:action/actions/AWS_EC2.InstanceId.Reboot/1.0</code> Note You must create at least one reboot alarm using the Amazon EC2 or CloudWatch console to create the EC2ActionsAccess IAM role. After this IAM role is created, you can create reboot alarms using the AWS CLI.
Recover	<code>arn:aws:automate:us-east-1:ec2:recover</code>	n/a

Understanding Resource Ownership

The AWS account owns the resources that are created in the account, regardless of who created the resources. Specifically, the resource owner is the AWS account of the [principal entity](#) (that is, the AWS account root user, an IAM user, or an IAM role) that authenticates the resource creation request. CloudWatch does not have any resources that you can own.

Managing Access to Resources

A *permissions policy* describes who has access to what. The following section explains the available options for creating permissions policies.

Note

This section discusses using IAM in the context of CloudWatch. It doesn't provide detailed information about the IAM service. For complete IAM documentation, see [What Is IAM?](#) in the *IAM User Guide*. For information about IAM policy syntax and descriptions, see [IAM Policy Reference](#) in the *IAM User Guide*.

Policies attached to an IAM identity are referred to as identity-based policies (IAM policies) and policies attached to a resource are referred to as resource-based policies. CloudWatch supports only identity-based policies.

Topics

- [Identity-Based Policies \(IAM Policies\)](#) (p. 292)
- [Resource-Based Policies \(IAM Policies\)](#) (p. 293)

Identity-Based Policies (IAM Policies)

You can attach policies to IAM identities. For example, you can do the following:

- **Attach a permissions policy to a user or a group in your account** – To grant a user permissions to create an Amazon CloudWatch resource, such as metrics, you can attach a permissions policy to a user or group that the user belongs to.
- **Attach a permissions policy to a role (grant cross-account permissions)** – You can attach an identity-based permissions policy to an IAM role to grant cross-account permissions. For example, the administrator in account A can create a role to grant cross-account permissions to another AWS account (for example, account B) or an AWS service as follows:
 1. Account A administrator creates an IAM role and attaches a permissions policy to the role that grants permissions on resources in account A.
 2. Account A administrator attaches a trust policy to the role identifying account B as the principal who can assume the role.
 3. Account B administrator can then delegate permissions to assume the role to any users in account B. Doing this allows users in account B to create or access resources in account A. The principal in the trust policy can also be an AWS service principal if you want to grant an AWS service permissions to assume the role.

For more information about using IAM to delegate permissions, see [Access Management](#) in the *IAM User Guide*.

For more information about using identity-based policies with CloudWatch, see [Using Identity-Based Policies \(IAM Policies\) for CloudWatch \(p. 294\)](#). For more information about users, groups, roles, and permissions, see [Identities \(Users, Groups, and Roles\)](#) in the *IAM User Guide*.

Resource-Based Policies (IAM Policies)

Other services, such as Amazon S3, also support resource-based permissions policies. For example, you can attach a policy to an Amazon S3 bucket to manage access permissions to that bucket. CloudWatch doesn't support resource-based policies.

Specifying Policy Elements: Actions, Effects, and Principals

For each CloudWatch resource, the service defines a set of API operations. To grant permissions for these API operations, CloudWatch defines a set of actions that you can specify in a policy. Some API operations can require permissions for more than one action in order to perform the API operation. For more information about resources and API operations, see [CloudWatch Resources and Operations \(p. 290\)](#) and CloudWatch [Actions](#).

The following are the basic policy elements:

- **Resource** – Use an Amazon Resource Name (ARN) to identify the resource that the policy applies to. CloudWatch does not have any resources for you to control using policies resources, so use the wildcard character (*) in IAM policies. For more information, see [CloudWatch Resources and Operations \(p. 290\)](#).
- **Action** – Use action keywords to identify resource operations that you want to allow or deny. For example, the `cloudwatch:ListMetrics` permission allows the user permissions to perform the `ListMetrics` operation.
- **Effect** – You specify the effect, either allow or deny, when the user requests the specific action. If you don't explicitly grant access to (allow) a resource, access is implicitly denied. You can also explicitly deny access to a resource, which you might do to make sure that a user cannot access it, even if a different policy grants access.
- **Principal** – In identity-based policies (IAM policies), the user that the policy is attached to is the implicit principal. For resource-based policies, you specify the user, account, service, or other entity

that you want to receive permissions (applies to resource-based policies only). CloudWatch doesn't support resource-based policies.

To learn more about IAM policy syntax and descriptions, see [AWS IAM JSON Policy Reference](#) in the *IAM User Guide*.

For a table showing all of the CloudWatch API actions and the resources that they apply to, see [Amazon CloudWatch Permissions Reference](#) (p. 303).

Specifying Conditions in a Policy

When you grant permissions, you can use the access policy language to specify the conditions when a policy should take effect. For example, you might want a policy to be applied only after a specific date. For more information about specifying conditions in a policy language, see [Condition](#) in the *IAM User Guide*.

To express conditions, you use predefined condition keys. For a list of context keys supported by each AWS service and a list of AWS-wide policy keys, see [AWS Service Actions and Condition Context Keys](#) and [Global and IAM Condition Context Keys](#) in the *IAM User Guide*.

Using Identity-Based Policies (IAM Policies) for CloudWatch

This topic provides examples of identity-based policies that demonstrate how an account administrator can attach permissions policies to IAM identities (that is, users, groups, and roles) and thereby grant permissions to perform operations on CloudWatch resources.

Important

We recommend that you first review the introductory topics that explain the basic concepts and options available to manage access to your CloudWatch resources. For more information, see [Access Control](#) (p. 289).

The sections in this topic cover the following:

- [Permissions Required to Use the CloudWatch Console](#) (p. 295)
- [AWS Managed \(Predefined\) Policies for CloudWatch](#) (p. 297)
- [Customer Managed Policy Examples](#) (p. 298)

The following shows an example of a permissions policy.

```
{
  "Version": "2012-10-17",
  "Statement": [{
    "Effect": "Allow",
    "Action": ["cloudwatch:GetMetricStatistics", "cloudwatch:ListMetrics"],
    "Resource": "*",
    "Condition": {
      "Bool": {
        "aws:SecureTransport": "true"
      }
    }
  }]
}
```

```
}
```

This sample policy has one statement that grants permissions to a group for two CloudWatch actions (`cloudwatch:GetMetricStatisticsdata`, and `cloudwatch:ListMetrics`), but only if the group uses SSL with the request (`"aws:SecureTransport": "true"`). For more information about the elements within an IAM policy statement, see [Specifying Policy Elements: Actions, Effects, and Principals \(p. 293\)](#) and [IAM Policy Elements Reference](#) in *IAM User Guide*.

Permissions Required to Use the CloudWatch Console

For a user to work with the CloudWatch console, that user must have a minimum set of permissions that allow the user to describe other AWS resources in their AWS account. The CloudWatch console requires permissions from the following services:

- Amazon EC2 Auto Scaling
- CloudTrail
- CloudWatch
- CloudWatch Events
- CloudWatch Logs
- Amazon EC2
- Amazon ES
- IAM
- Kinesis
- Lambda
- Amazon S3
- Amazon SNS
- Amazon SQS
- Amazon SWF

If you create an IAM policy that is more restrictive than the minimum required permissions, the console won't function as intended for users with that IAM policy. To ensure that those users can still use the CloudWatch console, also attach the `CloudWatchReadOnlyAccess` managed policy to the user, as described in [AWS Managed \(Predefined\) Policies for CloudWatch \(p. 297\)](#).

You don't need to allow minimum console permissions for users that are making calls only to the AWS CLI or the CloudWatch API.

The full set of permissions required to work with the CloudWatch console are listed below:

- `applicationautoscaling:describeScalingPolicies`
- `autoscaling:describeAutoScalingGroups`
- `autoscaling:describePolicies`
- `cloudtrail:describeTrails`
- `cloudwatch:deleteAlarms`
- `cloudwatch:describeAlarmHistory`
- `cloudwatch:describeAlarms`
- `cloudwatch:getMetricData`
- `cloudwatch:getMetricStatistics`
- `cloudwatch:listMetrics`

- cloudwatch:putMetricAlarm
- cloudwatch:putMetricData
- ec2:describeInstances
- ec2:describeTags
- ec2:describeVolumes
- es:describeElasticsearchDomain
- es:listDomainNames
- events:deleteRule
- events:describeRule
- events:disableRule
- events:enableRule
- events:listRules
- events:putRule
- iam:attachRolePolicy
- iam:createRole
- iam:getPolicy
- iam:getPolicyVersion
- iam:getRole
- iam:listAttachedRolePolicies
- iam:listRoles
- kinesis:describeStreams
- kinesis:listStreams
- lambda:addPermission
- lambda:createFunction
- lambda:getFunctionConfiguration
- lambda:listAliases
- lambda:listFunctions
- lambda:listVersionsByFunction
- lambda:removePermission
- logs:cancelExportTask
- logs:createExportTask
- logs:createLogGroup
- logs:createLogStream
- logs:deleteLogGroup
- logs:deleteLogStream
- logs:deleteMetricFilter
- logs:deleteRetentionPolicy
- logs:deleteSubscriptionFilter
- logs:describeExportTasks
- logs:describeLogGroups
- logs:describeLogStreams
- logs:describeMetricFilters

- logs:describeSubscriptionFilters
- logs:filterLogEvents
- logs:getLogEvents
- logs:putMetricFilter
- logs:putRetentionPolicy
- logs:putSubscriptionFilter
- logs:testMetricFilter
- s3:createBucket
- s3:listBuckets
- sns:createTopic
- sns:getTopicAttributes
- sns:listSubscriptions
- sns:listTopics
- sns:setTopicAttributes
- sns:subscribe
- sns:unsubscribe
- sqs:getQueueAttributes
- sqs:getQueueUrl
- sqs:listQueues
- sqs:setQueueAttributes
- swf:createAction
- swf:describeAction
- swf:listActionTemplates
- swf:registerAction
- swf:registerDomain
- swf:updateAction

AWS Managed (Predefined) Policies for CloudWatch

AWS addresses many common use cases by providing standalone IAM policies that are created and administered by AWS. These AWS managed policies grant necessary permissions for common use cases so that you can avoid having to investigate what permissions are needed. For more information, see [AWS Managed Policies](#) in the *IAM User Guide*.

The following AWS managed policies, which you can attach to users in your account, are specific to CloudWatch:

- **CloudWatchFullAccess** – Grants full access to CloudWatch.
- **CloudWatchReadOnlyAccess** – Grants read-only access to CloudWatch.
- **CloudWatchActionsEC2Access** – Grants read-only access to CloudWatch alarms and metrics in addition to Amazon EC2 metadata. Grants access to the Stop, Terminate, and Reboot API actions for EC2 instances.

Note

You can review these permissions policies by signing in to the IAM console and searching for specific policies there.

You can also create your own custom IAM policies to allow permissions for CloudWatch actions and resources. You can attach these custom policies to the IAM users or groups that require those permissions.

Customer Managed Policy Examples

In this section, you can find example user policies that grant permissions for various CloudWatch actions. These policies work when you are using the CloudWatch API, AWS SDKs, or the AWS CLI.

Examples

- [Example 1: Allow User Full Access to CloudWatch \(p. 298\)](#)
- [Example 2: Allow Read-Only Access to CloudWatch \(p. 298\)](#)
- [Example 3: Stop or Terminate an Amazon EC2 Instance \(p. 299\)](#)

Example 1: Allow User Full Access to CloudWatch

The following policy allows a user to access all CloudWatch actions, CloudWatch Logs actions, Amazon SNS actions, and read-only access to Auto Scaling.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Action": [
        "autoscaling:Describe*",
        "cloudwatch:*",
        "logs:*",
        "sns:*"
      ],
      "Effect": "Allow",
      "Resource": "*"
    }
  ]
}
```

Example 2: Allow Read-Only Access to CloudWatch

The following policy allows a user read-only access to CloudWatch and view Auto Scaling actions, CloudWatch metrics, CloudWatch Logs data, and alarm-related Amazon SNS data.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Action": [
        "autoscaling:Describe*",
        "cloudwatch:Describe*",
        "cloudwatch:Get*",
        "cloudwatch:List*",
        "logs:Get*",
        "logs:Describe*",
        "sns:Get*",
        "sns:List*"
      ],
      "Effect": "Allow",
      "Resource": "*"
    }
  ]
}
```

```
]
}
```

Example 3: Stop or Terminate an Amazon EC2 Instance

The following policy allows an CloudWatch alarm action to stop or terminate an EC2 instance. In the sample below, the GetMetricStatistics, ListMetrics, and DescribeAlarms actions are optional. It is recommended that you include these actions to ensure that you have correctly stopped or terminated the instance.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Action": [
        "cloudwatch:PutMetricAlarm",
        "cloudwatch:GetMetricStatistics",
        "cloudwatch:ListMetrics",
        "cloudwatch:DescribeAlarms"
      ],
      "Sid": "0000000000000000",
      "Resource": [
        "*"
      ],
      "Effect": "Allow"
    },
    {
      "Action": [
        "ec2:DescribeInstanceStatus",
        "ec2:DescribeInstances",
        "ec2:StopInstances",
        "ec2:TerminateInstances"
      ],
      "Sid": "0000000000000000",
      "Resource": [
        "*"
      ],
      "Effect": "Allow"
    }
  ]
}
```

Using Service-Linked Roles for CloudWatch Alarms

Amazon CloudWatch uses AWS Identity and Access Management (IAM) [service-linked roles](#). A service-linked role is a unique type of IAM role that is linked directly to CloudWatch. Service-linked roles are predefined by CloudWatch and include all the permissions that the service requires to call other AWS services on your behalf.

The service-linked role in CloudWatch makes setting up CloudWatch alarms that can terminate, stop, or reboot Amazon EC2 instance easier because you don't have to manually add the necessary permissions. CloudWatch defines the permissions of the service-linked role, and unless defined otherwise, only CloudWatch can assume the role. The defined permissions include the trust policy and the permissions policy, and that permissions policy cannot be attached to any other IAM entity.

You can delete the roles only after first deleting their related resources. This protects your CloudWatch resources because you can't inadvertently remove permission to access the resources.

For information about other services that support service-linked roles, see [AWS Services That Work with IAM](#) and look for the services that have **Yes** in the **Service-Linked Role** column. Choose a **Yes** with a link to view the service-linked role documentation for that service.

Service-Linked Role Permissions for CloudWatch Alarms

CloudWatch uses the service-linked role named **AWSServiceRoleForCloudWatchEvents** – CloudWatch uses this service-linked role to perform Amazon EC2 alarm actions.

The **AWSServiceRoleForCloudWatchEvents** service-linked role trusts the CloudWatch Events service to assume the role. CloudWatch Events invokes the terminate, stop, or reboot instance actions when called upon by the alarm.

The **AWSServiceRoleForCloudWatchEvents** service-linked role permissions policy allows CloudWatch Events to complete the following actions on Amazon EC2 instances:

- `ec2:StopInstances`
- `ec2:TerminateInstances`
- `ec2:RecoverInstances`
- `ec2:DescribeInstanceRecoveryAttribute`
- `ec2:DescribeInstances`
- `ec2:DescribeInstanceState`

Creating a Service-Linked Role for CloudWatch Alarms

You can use the AWS CLI or the AWS API to create the CloudWatch Events service-linked role. You cannot use the AWS Management Console at this time.

To use the AWS CLI create the service-linked role for CloudWatch Events, use the following command:

```
aws iam create-service-linked-role --aws-service-name events.amazonaws.com
```

For more information, see [Creating a Service-Linked Role](#) in the *IAM User Guide*.

Creating a Service-Linked Role for CloudWatch Alarms

CloudWatch does not allow you to edit the **AWSServiceRoleForCloudWatchEvents** role. After you create the role, you cannot change the name of the role because various entities might reference the role. However, you can edit the description of the **AWSServiceRoleForCloudWatchEvents** role using IAM.

Editing a Service-Linked Role Description (IAM Console)

You can use the IAM console to edit the description of a service-linked role.

To edit the description of a service-linked role (console)

1. In the navigation pane of the IAM console, choose **Roles**.
2. Choose the name of the role to modify.

3. To the far right of **Role description**, choose **Edit**.
4. Type a new description in the box and choose **Save**.

Editing a Service-Linked Role Description (AWS CLI)

You can use IAM commands from the AWS Command Line Interface to edit the description of a service-linked role.

To change the description of a service-linked role (AWS CLI)

1. (Optional) To view the current description for a role, use the following commands:

```
$ aws iam get-role --role-name role-name
```

Use the role name, not the ARN, to refer to roles with the AWS CLI commands. For example, if a role has the following ARN: `arn:aws:iam::123456789012:role/myrole`, you refer to the role as **myrole**.

2. To update a service-linked role's description, use the following command:

```
$ aws iam update-role-description --role-name role-name --description description
```

Editing a Service-Linked Role Description (IAM API)

You can use the IAM API to edit the description of a service-linked role.

To change the description of a service-linked role (API)

1. (Optional) To view the current description for a role, use the following command:

`GetRole`

2. To update a role's description, use the following command:

`UpdateRoleDescription`

Deleting a Service-Linked Role for CloudWatch Alarms

If you no longer have alarms that automatically stop, terminate, or reboot EC2 instances, we recommend that you delete the `AWSServiceRoleForCloudWatchEvents` role. That way you don't have an unused entity that is not actively monitored or maintained. However, you must clean up your service-linked role before you can delete it.

Cleaning Up a Service-Linked Role

Before you can use IAM to delete a service-linked role, you must first confirm that the role has no active sessions and remove any resources used by the role.

To check whether the service-linked role has an active session in the IAM console

1. Open the IAM console at <https://console.aws.amazon.com/iam/>.
2. In the navigation pane, choose **Roles**. Choose the name (not the check box) of the `AWSServiceRoleForCloudWatchEvents` role.

3. On the **Summary** page for the selected role, choose **Access Advisor** and review the recent activity for the service-linked role.

Note

If you are unsure whether CloudWatch is using the `AWSServiceRoleForCloudWatchEvents` role, try to delete the role. If the service is using the role, then the deletion fails and you can view the regions where the role is being used. If the role is being used, then you must wait for the session to end before you can delete the role. You cannot revoke the session for a service-linked role.

Deleting a Service-Linked Role (IAM Console)

You can use the IAM console to delete a service-linked role.

To delete a service-linked role (console)

1. Open the IAM console at <https://console.aws.amazon.com/iam/>.
2. In the navigation pane, choose **Roles**. Select the check box next to `AWSServiceRoleForCloudWatchEvents`, not the name or row itself.
3. For **Role actions**, choose **Delete role**.
4. In the confirmation dialog box, review the service last accessed data, which shows when each of the selected roles last accessed an AWS service. This helps you to confirm whether the role is currently active. To proceed, choose **Yes, Delete**.
5. Watch the IAM console notifications to monitor the progress of the service-linked role deletion. Because the IAM service-linked role deletion is asynchronous, the deletion task can succeed or fail after you submit the role for deletion. If the task fails, choose **View details** or **View Resources** from the notifications to learn why the deletion failed. If the deletion fails because there are resources in the service that are being used by the role, then the reason for the failure includes a list of resources.

Deleting a Service-Linked Role (AWS CLI)

You can use IAM commands from the AWS Command Line Interface to delete a service-linked role.

To delete a service-linked role (AWS CLI)

1. Because a service-linked role cannot be deleted if it is being used or has associated resources, you must submit a deletion request. That request can be denied if these conditions are not met. You must capture the `deletion-task-id` from the response to check the status of the deletion task. Type the following command to submit a service-linked role deletion request:

```
$ aws iam delete-service-linked-role --role-name AWSServiceRoleForCloudWatchEvents
```

2. Type the following command to check the status of the deletion task:

```
$ aws iam get-service-linked-role-deletion-status --deletion-task-id deletion-task-id
```

The status of the deletion task can be `NOT_STARTED`, `IN_PROGRESS`, `SUCCEEDED`, or `FAILED`. If the deletion fails, the call returns the reason that it failed so that you can troubleshoot.

Deleting a Service-Linked Role (IAM API)

You can use the IAM API to delete a service-linked role.

To delete a service-linked role (API)

1. To submit a deletion request for a service-linked roll, call [DeleteServiceLinkedRole](#). In the request, specify the `AWSServiceRoleForCloudWatchEvents` role name.

Because a service-linked role cannot be deleted if it is being used or has associated resources, you must submit a deletion request. That request can be denied if these conditions are not met. You must capture the `DeletionTaskId` from the response to check the status of the deletion task.

2. To check the status of the deletion, call [GetServiceLinkedRoleDeletionStatus](#). In the request, specify the `DeletionTaskId`.

The status of the deletion task can be `NOT_STARTED`, `IN_PROGRESS`, `SUCCEEDED`, or `FAILED`. If the deletion fails, the call returns the reason that it failed so that you can troubleshoot.

Amazon CloudWatch Permissions Reference

When you are setting up [Access Control](#) (p. 289) and writing permissions policies that you can attach to an IAM identity (identity-based policies), you can use the following table as a reference. The table lists each CloudWatch API operation and the corresponding actions for which you can grant permissions to perform the action. You specify the actions in the policy's `Action` field, and you specify a wildcard character (*) as the resource value in the policy's `Resource` field.

You can use AWS-wide condition keys in your CloudWatch policies to express conditions. For a complete list of AWS-wide keys, see [AWS Global and IAM Condition Context Keys](#) in the *IAM User Guide*.

Note

To specify an action, use the `cloudwatch:` prefix followed by the API operation name. For example: `cloudwatch:GetMetricStatistics`, `cloudwatch:ListMetrics`, or `cloudwatch:*` (for all CloudWatch actions).

Tables

- [CloudWatch API Operations and Required Permissions](#)
- [CloudWatch Events API Operations and Required Permissions](#)
- [CloudWatch Logs API Operations and Required Permissions](#)
- [Amazon EC2 API Operations and Required Permissions](#)
- [Auto Scaling API Operations and Required Permissions](#)

CloudWatch API Operations and Required Permissions for Actions

CloudWatch API Operations	Required Permissions (API Actions)
DeleteAlarms	<code>cloudwatch:DeleteAlarms</code> Required to delete an alarm.
DeleteDashboards	<code>cloudwatch:DeleteDashboards</code> Required to delete a dashboard.
DescribeAlarmHistory	<code>cloudwatch:DescribeAlarmHistory</code> Required to view alarm history.
DescribeAlarms	<code>cloudwatch:DescribeAlarms</code> Required to retrieve alarm information by name.

CloudWatch API Operations	Required Permissions (API Actions)
DescribeAlarmsForMetric	<code>cloudwatch:DescribeAlarmsForMetric</code> Required to view alarms for a metric.
DisableAlarmActions	<code>cloudwatch:DisableAlarmActions</code> Required to disable an alarm action.
EnableAlarmActions	<code>cloudwatch:EnableAlarmActions</code> Required to enable an alarm action.
GetDashboard	<code>cloudwatch:GetDashboard</code> Required to display data about existing dashboards.
GetMetricStatistics	<code>cloudwatch:GetMetricStatistics</code> Required to view graphs in other parts of the CloudWatch console and in dashboard widgets.
ListDashboards	<code>cloudwatch:ListDashboards</code> Required to view the list of CloudWatch dashboards in your account.
ListMetrics	<code>cloudwatch:ListMetrics</code> Required to view or search metric names within the CloudWatch console and in the CLI. Required to select metrics on dashboard widgets.
PutDashboard	<code>cloudwatch:PutDashboard</code> Required to create a dashboard or update an existing dashboard.
PutMetricAlarm	<code>cloudwatch:PutMetricAlarm</code> Required to create or update an alarm.
PutMetricData	<code>cloudwatch:PutMetricData</code> Required to create metrics.
SetAlarmState	<code>cloudwatch:SetAlarmState</code> Required to manually set an alarm's state.

CloudWatch Events API Operations and Required Permissions for Actions

CloudWatch Events API Operations	Required Permissions (API Actions)
DeleteRule	<code>events:DeleteRule</code> Required to delete a rule.
DescribeRule	<code>events:DescribeRule</code>

CloudWatch Events API Operations	Required Permissions (API Actions)
	Required to list the details about a rule.
DisableRule	events:DisableRule Required to disable a rule.
EnableRule	events:EnableRule Required to enable a rule.
ListRuleNamesByTarget	events:ListRuleNamesByTarget Required to list rules associated with a target.
ListRules	events:ListRules Required to list all rules in your account.
ListTargetsByRule	events:ListTargetsByRule Required to list all targets associated with a rule.
PutEvents	events:PutEvents Required to add custom events that can be matched to rules.
PutRule	events:PutRule Required to create or update a rule.
PutTargets	events:PutTargets Required to add targets to a rule.
RemoveTargets	events:RemoveTargets Required to remove a target from a rule.
TestEventPattern	events:TestEventPattern Required to test an event pattern against a given event.

CloudWatch Logs API Operations and Required Permissions for Actions

CloudWatch Logs API Operations	Required Permissions (API Actions)
CancelExportTask	logs:CancelExportTask Required to cancel a pending or running export task.
CreateExportTask	logs:CreateExportTask Required to export data from a log group to an Amazon S3 bucket.
CreateLogGroup	logs:CreateLogGroup

CloudWatch Logs API Operations	Required Permissions (API Actions)
	Required to create a new log group.
CreateLogStream	logs:CreateLogStream Required to create a new log stream in a log group.
DeleteDestination	logs:DeleteDestination Required to delete a log destination and disables any subscription filters to it.
DeleteLogGroup	logs:DeleteLogGroup Required to delete a log group and any associated archived log events.
DeleteLogStream	logs:DeleteLogStream Required to delete a log stream and any associated archived log events.
DeleteMetricFilter	logs:DeleteMetricFilter Required to delete a metric filter associated with a log group.
DeleteRetentionPolicy	logs:DeleteRetentionPolicy Required to delete a log group's retention policy.
DeleteSubscriptionFilter	logs:DeleteSubscriptionFilter Required to delete the subscription filter associated with a log group.
DescribeDestinations	logs:DescribeDestinations Required to view all destinations associated with the account.
DescribeExportTasks	logs:DescribeExportTasks Required to view all export tasks associated with the account.
DescribeLogGroups	logs:DescribeLogGroups Required to view all log groups associated with the account.
DescribeLogStreams	logs:DescribeLogStreams Required to view all log streams associated with a log group.

CloudWatch Logs API Operations	Required Permissions (API Actions)
DescribeMetricFilters	<code>logs:DescribeMetricFilters</code> Required to view all metrics associated with a log group.
DescribeSubscriptionFilters	<code>logs:DescribeSubscriptionFilters</code> Required to view all subscription filters associated with a log group.
FilterLogEvents	<code>logs:FilterLogEvents</code> Required to sort log events by log group filter pattern.
GetLogEvents	<code>logs:GetLogEvents</code> Required to retrieve log events from a log stream.
ListTagsLogGroup	<code>logs:ListTagsLogGroup</code> Required to list the tags associated with a log group.
PutDestination	<code>logs:PutDestination</code> Required to create or update a destination log stream (such as a Kinesis stream).
PutDestinationPolicy	<code>logs:PutDestinationPolicy</code> Required to create or update an access policy associated with an existing log destination.
PutLogEvents	<code>logs:PutLogEvents</code> Required to upload a batch of log events to a log stream.
PutMetricFilter	<code>logs:PutMetricFilter</code> Required to create or update a metric filter and associate it with a log group.
PutRetentionPolicy	<code>logs:PutRetentionPolicy</code> Required to set the number of days to keep log events (retention) in a log group.
PutSubscriptionFilter	<code>logs:PutSubscriptionFilter</code> Required to create or update a subscription filter and associate it with a log group.
TestMetricFilter	<code>logs:TestMetricFilter</code> Required to test a filter pattern against a sampling of log event messages.

Amazon EC2 API Operations and Required Permissions for Actions

Amazon EC2 API Operations	Required Permissions (API Actions)
DescribeInstanceStatus	<code>ec2:DescribeInstanceStatus</code> Required to view EC2 instance status details.
DescribeInstances	<code>ec2:DescribeInstances</code> Required to view EC2 instance details.
RebootInstances	<code>ec2:RebootInstances</code> Required to reboot an EC2 instance.
StopInstances	<code>ec2:StopInstances</code> Required to stop an EC2 instance.
TerminateInstances	<code>ec2:TerminateInstances</code> Required to terminate an EC2 instance.

Auto Scaling API Operations and Required Permissions for Actions

Auto Scaling API Operations	Required Permissions (API Actions)
Scaling	<code>autoscaling:Scaling</code> Required to scale an Auto Scaling group.
Trigger	<code>autoscaling:Trigger</code> Required to trigger an Auto Scaling action.

Logging Amazon CloudWatch API Calls in AWS CloudTrail

AWS CloudTrail is a service that captures API calls made by or on behalf of your AWS account. This information is collected and written to log files that are stored in an Amazon S3 bucket that you specify. API calls are logged whenever you use the API, the console, or the AWS CLI. Using the information collected by CloudTrail, you can determine what request was made, the source IP address the request was made from, who made the request, when it was made, and so on.

To learn more about CloudTrail, including how to configure and enable it, see the [What is AWS CloudTrail](#) in the *AWS CloudTrail User Guide*.

Topics

- [CloudWatch Information in CloudTrail](#) (p. 309)
- [Understanding Log File Entries](#) (p. 311)

CloudWatch Information in CloudTrail

If CloudTrail logging is turned on, calls made to API actions are captured in log files. Every log file entry contains information about who generated the request. For example, if a request is made to create or update a CloudWatch alarm (`PutMetricAlarm`), CloudTrail logs the user identity of the person or service that made the request.

The user identity information in the log entry helps you determine the following:

- Whether the request was made with root or IAM user credentials
- Whether the request was made with temporary security credentials for a role or federated user
- Whether the request was made by another AWS service

For more information, see the [CloudTrail `userIdentity` Element](#) in the *AWS CloudTrail User Guide*.

You can store your log files in your bucket for as long as you want, but you can also define Amazon S3 lifecycle rules to archive or delete log files automatically. By default, your log files are encrypted by using Amazon S3 server-side encryption (SSE).

If you want to be notified upon log file delivery, you can configure CloudTrail to publish Amazon SNS notifications when new log files are delivered. For more information, see [Configuring Amazon SNS Notifications for CloudTrail](#) in the *AWS CloudTrail User Guide*.

You can also aggregate Amazon CloudWatch Logs log files from multiple AWS regions and multiple AWS accounts into a single Amazon S3 bucket. For more information, see [Receiving CloudTrail Log Files from Multiple Regions](#) and [Receiving CloudTrail Log Files from Multiple Accounts](#) in the *AWS CloudTrail User Guide*.

When logging is turned on, the following API actions are written to CloudTrail:

CloudWatch

- DeleteAlarms
- DescribeAlarmHistory
- DescribeAlarms
- DescribeAlarmsForMetric
- DisableAlarmActions
- EnableAlarmActions
- PutMetricAlarm
- SetAlarmState

The CloudWatch `GetMetricStatistics`, `ListMetrics`, and `PutMetricData` API actions are not supported. For more information about all of these actions, see the [Amazon CloudWatch API Reference](#).

CloudWatch Events

- DeleteRule
- DescribeRule
- DisableRule
- EnableRule
- ListRuleNamesByTarget
- ListRules
- ListTargetsByRule
- PutRule
- PutTargets
- RemoveTargets
- TestEventPattern

For more information about these actions, see the [Amazon CloudWatch Events API Reference](#).

CloudWatch Logs Request and response elements are logged for these API actions:

- CancelExportTask
- CreateExportTask
- CreateLogGroup
- CreateLogStream
- DeleteDestination
- DeleteLogGroup
- DeleteLogStream
- DeleteMetricFilter
- DeleteRetentionPolicy
- DeleteSubscriptionFilter
- PutDestination
- PutDestinationPolicy
- PutMetricFilter
- PutRetentionPolicy
- PutSubscriptionFilter
- TestMetricFilter

Only Request elements are logged for these API actions:

- DescribeDestinations
- DescribeExportTasks
- DescribeLogGroups
- DescribeLogStreams
- DescribeMetricFilters
- DescribeSubscriptionFilters

The CloudWatch Logs `GetLogEvents`, `PutLogEvents`, and `FilterLogEvents` API actions are not supported. For more information about these actions, see the [Amazon CloudWatch Logs API Reference](#).

Understanding Log File Entries

CloudTrail log files contain one or more log entries. Each entry lists multiple JSON-formatted events. A log entry represents a single request from any source and includes information about the requested action, the date and time of the action, request parameters, and so on. The log entries are not an ordered stack trace of the public API calls, so they do not appear in any specific order. Log file entries for all API actions are similar to the examples below.

The following log file entry shows that a user called the CloudWatch **PutMetricAlarm** action.

```
{
  "Records": [{
    "eventVersion": "1.01",
    "userIdentity": {
      "type": "Root",
      "principalId": "EX_PRINCIPAL_ID",
      "arn": "arn:aws:iam::123456789012:root",
      "accountId": "123456789012",
      "accessKeyId": "EXAMPLE_KEY_ID"
    },
    "eventTime": "2014-03-23T21:50:34Z",
    "eventSource": "monitoring.amazonaws.com",
    "eventName": "PutMetricAlarm",
    "awsRegion": "us-east-1",
    "sourceIPAddress": "127.0.0.1",
    "userAgent": "aws-sdk-ruby2/2.0.0.rc4 ruby/1.9.3 x86_64-linux Seahorse/0.1.0",
    "requestParameters": {
      "threshold": 50.0,
      "period": 60,
      "metricName": "CloudTrail Test",
      "evaluationPeriods": 3,
      "comparisonOperator": "GreaterThanThreshold",
      "namespace": "AWS/CloudWatch",
      "alarmName": "CloudTrail Test Alarm",
      "statistic": "Sum"
    },
    "responseElements": null,
    "requestID": "29184022-b2d5-11e3-a63d-9b463e6d0ff0",
    "eventID": "b096d5b7-dcf2-4399-998b-5a53eca76a27"
  },
  ..additional entries
  ]
}
```

The following log file entry shows that a user called the CloudWatch Events **PutRule** action.

```
{
  "eventVersion": "1.03",
  "userIdentity": {
    "type": "Root",
    "principalId": "123456789012",
    "arn": "arn:aws:iam::123456789012:root",
    "accountId": "123456789012",
    "accessKeyId": "AKIAIOSFODNN7EXAMPLE",
    "sessionContext": {
      "attributes": {
        "mfaAuthenticated": "false",
        "creationDate": "2015-11-17T23:56:15Z"
      }
    }
  },
  "eventTime": "2015-11-18T00:11:28Z",
  "eventSource": "events.amazonaws.com",
  "eventName": "PutRule",
  "awsRegion": "us-east-1",
  "sourceIPAddress": "AWS Internal",
  "userAgent": "AWS CloudWatch Console",
  "requestParameters": {
    "description": "",
    "name": "ctest2",
    "state": "ENABLED",
    "eventPattern": "{\"source\": [\"aws.ec2\"], \"detail-type\": [\"EC2 Instance State-change Notification\"]}",
    "scheduleExpression": ""
  },
  "responseElements": {
    "ruleArn": "arn:aws:events:us-east-1:123456789012:rule/ctest2"
  },

Document History

The following table describes the important changes to the Amazon CloudWatch User Guide.

Change	Description	Release Date
CloudWatch agent	A new CloudWatch agent was released. You can use the a single multi-platform agent to collect custom both system metrics and log files from Amazon EC2 instances and on-premises servers. The new agent supports both Windows and Linux and enables customization of metrics collected, including sub-resource metrics such as per-CPU core. For more information, see Collect Metrics and Logs from Amazon EC2 Instances and On-Premises Servers with the CloudWatch Agent (p. 45).	7 September 2017
NAT gateway metrics	Added metrics for Amazon VPC NAT gateway. For more information, see Amazon VPC NAT Gateway Metrics and Dimensions (p. 260).	7 September 2017
High-resolution metrics	You can now optionally set up custom metrics as high-resolution metrics, with a granularity of as low as one second. For more information, see High-Resolution Metrics (p. 42).	26 July 2017
Dashboard APIs	You can now create, modify, and delete dashboards using APIs and the AWS CLI. For more information, see Create a CloudWatch Dashboard (p. 18).	6 July 2017
AWS Direct Connect metrics	Added metrics for AWS Direct Connect. For more information, see AWS Direct Connect Metrics and Dimensions (p. 118).	29 June 2017
Amazon VPC VPN metrics	Added metrics for Amazon VPC VPN. For more information, see Amazon VPC VPN Metrics and Dimensions (p. 263).	15 May 2017
AppStream 2.0 metrics	Added metrics for AppStream 2.0. For more information, see AppStream 2.0 Metrics and Dimensions (p. 102).	8 March 2017
CloudWatch console color picker	You can now choose the color for each metric on your dashboard widgets. For more information, see Edit a Graph on a CloudWatch Dashboard (p. 21).	27 February 2017
Alarms on dashboards	Alarms can now be added to dashboards. For more information, see Add or Remove an Alarm from a CloudWatch Dashboard (p. 23).	15 February 2017
Added metrics for Amazon Polly	Added metrics for Amazon Polly. For more information, see Amazon Polly Metrics (p. 223).	1 December 2016
Added metrics for Amazon Kinesis Data Analytics	Added metrics for Amazon Kinesis Data Analytics. For more information, see Amazon Kinesis Data Analytics Metrics (p. 198).	1 December 2016

Change	Description	Release Date
Added support for percentile statistics	You can specify any percentile, using up to two decimal places (for example, p95.45). For more information, see Percentiles (p. 7).	17 November 2016
Added metrics for Amazon Simple Email Service	Added metrics for Amazon Simple Email Service. For more information, see Amazon Simple Email Service Metrics and Dimensions (p. 238).	2 November 2016
Updated metrics retention	Amazon CloudWatch now retains metrics data for 15 months instead of 14 days.	1 November 2016
Updated metrics console interface	The CloudWatch console is updated with improvements to existing functionality and new functionality.	1 November 2016
Added metrics for Amazon Elastic Transcoder	Added metrics for Amazon Elastic Transcoder. For more information, see Amazon Elastic Transcoder Metrics and Dimensions (p. 183).	20 September 2016
Added metrics for Amazon API Gateway	Added metrics for Amazon API Gateway. For more information, see Amazon API Gateway Metrics and Dimensions (p. 100).	9 September 2016
Added metrics for AWS Key Management Service	Added metrics for AWS Key Management Service. For more information, see AWS Key Management Service Metrics and Dimensions (p. 213).	9 September 2016
Added metrics for the new Application Load Balancers supported by Elastic Load Balancing	Added metrics for Application Load Balancers. For more information, see Elastic Load Balancing Metrics and Dimensions (p. 157).	11 August 2016
Added new NetworkPacketsIn and NetworkPacketsOut metrics for Amazon EC2	Added new NetworkPacketsIn and NetworkPacketsOut metrics for Amazon EC2. For more information, see Amazon EC2 Metrics and Dimensions (p. 133).	23 March 2016
Added new metrics for Amazon EC2 Spot fleet	Added new metrics for Amazon EC2 Spot fleet. For more information, see Amazon EC2 Spot Fleet Metrics and Dimensions (p. 140).	21 March 2016
Added new CloudWatch Logs metrics	Added new CloudWatch Logs metrics. For more information, see Amazon CloudWatch Logs Metrics and Dimensions (p. 117).	10 March 2016
Added Amazon Elasticsearch Service and AWS WAF metrics and dimensions	Added Amazon Elasticsearch Service and AWS WAF metrics and dimensions. For more information, see Amazon Elasticsearch Service Metrics and Dimensions (p. 179) and AWS WAF Metrics and Dimensions (p. 264).	14 October 2015

Change	Description	Release Date
Added support for CloudWatch dashboards	Dashboards are customizable home pages in the CloudWatch console that you can use to monitor your resources in a single view, even those that are spread out across different regions. For more information, see Using Amazon CloudWatch Dashboards (p. 18) .	8 October 2015
Added AWS Lambda metrics and dimensions	Added AWS Lambda metrics and dimensions. For more information, see AWS Lambda Metrics and Dimensions (p. 214) .	4 September 2015
Added Amazon Elastic Container Service metrics and dimensions	Added Amazon Elastic Container Service metrics and dimensions. For more information, see Amazon ECS Metrics and Dimensions (p. 141) .	17 August 2015
Added Amazon Simple Storage Service metrics and dimensions	Added Amazon Simple Storage Service metrics and dimensions. For more information, see Amazon Simple Storage Service Metrics and Dimensions (p. 243) .	26 July 2015
New feature: Reboot alarm action	Added the reboot alarm action and new IAM role for use with alarm actions. For more information, see Create Alarms to Stop, Terminate, Reboot, or Recover an Instance (p. 279) .	23 July 2015
Added Amazon WorkSpaces metrics and dimensions	Added Amazon WorkSpaces metrics and dimensions. For more information, see Amazon WorkSpaces Metrics and Dimensions (p. 265) .	30 April 2015
Added Amazon Machine Learning metrics and dimensions	Added Amazon Machine Learning metrics and dimensions. For more information, see Amazon Machine Learning Metrics and Dimensions (p. 217) .	9 April 2015
New feature: Amazon EC2 instance recovery alarm actions	Updated alarm actions to include new EC2 instance recovery action. For more information, see Create Alarms to Stop, Terminate, Reboot, or Recover an Instance (p. 279) .	12 March 2015
Added Amazon CloudFront and Amazon CloudSearch metrics and dimensions	Added Amazon CloudFront and Amazon CloudSearch metrics and dimensions. For more information, see Amazon CloudFront Metrics and Dimensions (p. 106) and Amazon CloudSearch Metrics and Dimensions (p. 107) .	6 March 2015
Added Amazon Simple Workflow Service metrics and dimensions	Added Amazon Simple Workflow Service metrics and dimensions. For more information, see Amazon SWF Metrics and Dimensions (p. 248) .	9 May 2014
Updated guide to add support for AWS CloudTrail	Added a new topic to explain how you can use AWS CloudTrail to log activity in Amazon CloudWatch. For more information, see Logging Amazon CloudWatch API Calls in AWS CloudTrail (p. 309) .	30 April 2014

Change	Description	Release Date
Updated guide to use the new AWS Command Line Interface (AWS CLI)	<p>The AWS CLI is a cross-service CLI with a simplified installation, unified configuration, and consistent command line syntax. The AWS CLI is supported on Linux/Unix, Windows, and Mac. The CLI examples in this guide have been updated to use the new AWS CLI.</p> <p>For information about how to install and configure the new AWS CLI, see Getting Set Up with the AWS Command Line Interface in the <i>AWS Command Line Interface User Guide</i>.</p>	21 February 2014
Added Amazon Redshift and AWS OpsWorks metrics and dimensions	Added Amazon Redshift and AWS OpsWorks metrics and dimensions. For more information, see Amazon Redshift Metrics and Dimensions (p. 225) and AWS OpsWorks Metrics and Dimensions (p. 219) .	16 July 2013
Added Amazon Route 53 metrics and dimensions	Added Amazon Route 53 metrics and dimensions. For more information, see Route 53 Metrics and Dimensions (p. 234) .	26 June 2013
New feature: Amazon CloudWatch Alarm Actions	Added a new section to document Amazon CloudWatch alarm actions, which you can use to stop or terminate an Amazon Elastic Compute Cloud instance. For more information, see Create Alarms to Stop, Terminate, Reboot, or Recover an Instance (p. 279) .	8 January 2013
Updated EBS metrics	Updated the EBS metrics to include two new metrics for Provisioned IOPS volumes. For more information, see Amazon EBS Metrics and Dimensions (p. 152) .	20 November 2012
New billing alerts	You can now monitor your AWS charges using Amazon CloudWatch metrics and create alarms to notify you when you have exceeded the specified threshold. For more information, see Create a Billing Alarm to Monitor Your Estimated AWS Charges (p. 285) .	10 May 2012
New metrics	You can now access six new Elastic Load Balancing metrics that provide counts of various HTTP response codes. For more information, see Elastic Load Balancing Metrics and Dimensions (p. 157) .	19 October 2011
New feature	You can now access metrics from Amazon EMR. For more information, see Amazon EMR Metrics and Dimensions (p. 169) .	30 June 2011
New feature	You can now access metrics from Amazon Simple Notification Service and Amazon Simple Queue Service. For more information, see Amazon Simple Notification Service Metrics and Dimensions (p. 239) and Amazon SQS Metrics and Dimensions (p. 241) .	14 July 2011
New Feature	Added information about using the <code>PutMetricData</code> API to publish custom metrics. For more information, see Publish Custom Metrics (p. 42) .	10 May 2011

Change	Description	Release Date
Updated metrics retention	Amazon CloudWatch now retains the history of an alarm for two weeks rather than six weeks. With this change, the retention period for alarms matches the retention period for metrics data.	07 April 2011
New feature	Added ability to send Amazon Simple Notification Service or Auto Scaling notifications when a metric has crossed a threshold. For more information, see Alarms (p. 7) .	02 December 2010
New feature	A number of CloudWatch actions now include the MaxRecords and NextToken parameters, which enable you to control pages of results to display.	02 December 2010
New feature	This service now integrates with AWS Identity and Access Management (IAM).	02 December 2010
